

# ***Vigor2100 Series Broadband Router User's Guide***

Version1.0

# Preamble of Vigor2100 Series Residential Broadband Router

## Introduction

- Easy Internet-sharing of your broadband\* connection
- Robust firewall to help protect your network from external attacks

For V models:

- Built-in VoIP facilities enable to deploy cost-effective IP telephone infrastructure
- Plug in a telephone to use your broadband line for regular phone calls
- Integration with your existing phone line (POTS) with automatic failover during power cuts
- QoS assured priority for VoIP Internet traffic

For G models:

- 802.11g Compliant Wireless LAN access with security features

## Brief Overview

	<b>Vigor2100G</b>	<b>Vigor2100V</b>	<b>Vigor2100VG</b>
Broadband Router	*	*	*
802.11g WLAN AP	*	-	*
VoIP port	-	<b>one FXS</b>	<b>one FXS</b>
Life Line port	-	<b>one</b>	<b>one</b>

The Vigor2100 series are user-friendly broadband router with a built-in VoIP (Voice over IP) telephone port and/or 802.11g Wireless LAN access point. The visual design, with its stylish pleasing lines and brushed silver finish provide looks good enough to fit into any environment.

The Vigor2100 G models feature the prevailing wireless technology offering data transfer rate up to 54Mbps. It not only allow streaming video and other high bandwidth applications such as online gaming events to operate without the hassle of wires but also make streaming real-time programs more smooth and enjoyable.

The Vigor2100 V models' VoIP facilities can provide a cost-saving alternative to having an additional fixed line. By using the DrayTEL PSTN gateway (ITSP) you can also make calls to any regular phone line too, including mobiles, as well as receive calls from anyone - the call is carried to your phone via your internet connection so your regular phone line remains free for other people or calls.

The POTS life-line facility provides for automatic failover to your regular phone line in the event of power or Internet failure, as well as letting you use the same phone to access either your regular phone line or VoIP facility when required.

## Specifications

### *For Vigor2100 V models*

#### **VoIP (Voice over IP)**

- ◆ Supports one FXS(phone) port
- ◆ G.168 line echo-cancellation
- ◆ Gain control
- ◆ Jitter buffer
- ◆ Voice Codec: G.711 A/μ law, G.726, G.723.1, G.729 A/B, VAD/CNG
- ◆ Tone generation and detection: DTMF, Dial, Busy, Ring back
- ◆ Protocol: SIP, RTP/RTCP

#### **LAN**

- ◆ 4-port 10/100M Base-TX Ethernet switch
- ◆ DHCP server for IP assignment (up to 253 users)
- ◆ DNS cache and proxy

#### **WAN/Internet**

- ◆ One 10/100M Base-TX port with a RJ-45 connector
- ◆ Quick Start Wizard for Internet access
- ◆ DHCP client for cable service
- ◆ Static IP address assignment for fixed IP networks
- ◆ PPPoE client

#### **E-mail Detection**

- ◆ LED flashes to indicate E-mail is waiting on your mail server (POP3)

#### **Network Features**

- ◆ DHCP client/relay/server
- ◆ Dynamic DNS
- ◆ Call schedule
- ◆ Radius client
- ◆ UPnP

### *For Vigor2100 G models*

#### **Wireless Access Point**

- ◆ IEEE802.11b/g compliant
- ◆ Wireless client list
- ◆ Wireless security:
  - 64/128 bits WEP encryption
  - WPA/WPA2\* PSK (IEEE802.1i)
  - MAC address access control
  - Hidden SSID
- ◆ Access point discovery\*
- ◆ Wireless LAN isolation\*
- ◆ WDS\*

#### **Firewall Facilities**

- ◆ NAT/PAT, DMZ host, port-redirect/open port
- ◆ SPI (Stateful Packet Inspection)
- ◆ DoS/DDoS protection
- ◆ Flexible URL content filtering
- ◆ Rule-based packet filtering
- ◆ E-mail alert and logging via syslog
- ◆ VPN pass through

#### **Router Management**

- ◆ Quick Start Wizard
- ◆ Command Line Interface (Telnet)
- ◆ Telnet remote access support
- ◆ Built-in diagnostic function
- ◆ Firmware upgrade via TFTP/FTP
- ◆ Syslog

#### **Power Consumption**

- ◆ 15V DC 15Watt

\*future release

## Hardware Connection

### Example: Vigor2100V

## ***About This User's Guide***

This manual is designed to assist users in using one of the Vigor2100 series residential broadband router with VoIP. Information in this document has been carefully checked for accuracy and, however, no guarantee is given as to the correctness of the contents. The information contained in this document is subject to change without notice. Should you have any inquiries, please feel free to contact our support via E-mail, Fax or phone. For the latest product information and features, please visit our website at [www.draytek.com](http://www.draytek.com).

We apply  to some chapters in order to remind you of your special attention! Should you have any queries and suggestions, please do not hesitate to contact your local dealer or us via [support@draytek.com](mailto:support@draytek.com) or [info@draytek.com](mailto:info@draytek.com)!

# ***Copyright***

## **Copyright © 2005 by DrayTek Corporation**

All rights reserved. The information of this publication is protected by copyright. No part of this publication may be reproduced, transmitted, transcribed, stored in a retrieval system, or translated into any language without written permission from the copyright holders.

## **Trademark**

Microsoft is a registered trademark of Microsoft Corp. Windows and Windows 95/98/98SE/Me/NT/XP/2000 are trademarks of Microsoft Corp. Other trademarks and registered trademarks of products mentioned in this manual may be the properties of their respective owners and are only used for identification purposes.

## ***DrayTek Limited Warranty***

We warrant to the original end user (purchaser) that the routers will be free from any defects in workmanship or materials for a period of three (3) years from the date of purchase from the dealer. Please keep your purchase receipt in a safe place as it serves as proof of date of purchase.

During the warranty period, and upon proof of purchase, should the product have indications of failure due to faulty workmanship and/or materials, we will, at our discretion, repair or replace the defective products or components, without charge for either parts or labor, to whatever extent we deem necessary to restore the product to proper operating condition. Any replacement will consist of a new or remanufactured functionally equivalent product of equal value, and will be offered solely at our discretion. This warranty will not apply if the product is modified, misused, tampered with, damaged by an act of God, or subjected to abnormal working conditions.

The warranty does not cover the bundled or licensed software of other vendors. Defects which do not significantly affect the usability of the product will not be covered by the warranty.

We reserve the right to revise the manual and online documentation and to make changes from time to time in the contents hereof without obligation to notify any person of such revision or changes.

## ***Be a Registered Owner***

Online web registration at [www.draytek.com](http://www.draytek.com) is preferred. Alternatively, fill in the registration card and mail it to the address found on the reverse side of the card. Registered owners will receive future product and update information.

## ***Safety Instructions***

- Please read the installation guide thoroughly before you set up the router.
- The router is a complicated electronic device that may be repaired only by authorized and qualified personnel. Do not try to open or repair the router yourself.
- Do not place the router in a damp or humid place, e.g. a bathroom.
- The router should be used in a sheltered area, within a temperature range from +5 to +40 Celsius.
- Do not expose the router to direct sunlight or other heat sources. The housing and electronic components may be damaged by direct sunlight or heat sources.
- Keep the package out of reach of children.
- When you would like to dispose of the router, please follow the local regulations on conservation of the environment.

## ***European Community Declarations***

Manufacturer: DrayTek Corp.

Address: No. 26, Fu Shing Road, HuKou County, HsinChu Industrial Park,  
Hsin-Chu, Taiwan 303

Product: Vigor2100 Series Broadband Routers

DrayTek Corp. declares that Vigor2100 series of routers are in compliance with the following essential requirements and other relevant provisions of R&TTE Directive 1999/5/EEC.

The product conforms to the requirements of Electro-Magnetic Compatibility (EMC) Directive 89/336/EEC by complying with the requirements set forth in EN55022/Class B and EN55024/Class B.

The product conforms to the requirements of Low Voltage (LVD) Directive 73/23/EEC by complying with the requirements set forth in EN60950.

The Vigor2100VG/G are designed for the WLAN 2.4GHz network throughput EC region, Switzerland, and the restrictions of France.

## ***Regulatory Information***

### Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- ◆ Reorient or relocate the receiving antenna.
- ◆ Increase the separation between the equipment and receiver.
- ◆ Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- ◆ Consult the dealer or an experienced radio/TV technician for help.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference, and
- (2) This device must accept any interference received, including interference that may cause undesired operation.

## ***Customer Support***

Please prepare the following information as you contact your customer support.

- Product model and serial number.
- Warranty information.
- Date that you received your router.
- Brief description of your problem.
- Steps that you may take to solve it and their associated SysLog messages.

The information of customer support and sales representatives are [support@draytek.com](mailto:support@draytek.com) and [sales@draytek.com](mailto:sales@draytek.com), respectively.

# Chapter 1

## Quick Start Wizard

---

### 1.1 Introduction

The Quick Start Wizard is designed for you to easily set up your broadband Internet access. We already integrated Quick Start Wizard into the Web Configurator of Vigor2100 series. You can directly access the Quick Start Wizard via Web Configurator.

### 1.2 Configure Your Router via Quick Start Wizard

- Step 1.** Open the web browser on a PC, which is, connected to the router and then link to the gateway IP address of the router (the default setting is **192.168.1.1**). Once your link (**http://192.168.1.1**) is successful, a pop-up window will open to ask for username and password. Leave the default null value and press **OK** to continue.

If you fail to access to the web configuration, please refer to "Trouble Shooting" guide.

## Quick Start Wizard

---

**Step 2.** The **Main Menu** will pop out after completing previous step.

**Step 3.** Now Quick Start Wizard is switched on. Enter login password. Then click **Next** to continue.

### Enter login password

---

There is no default password. For security, please choose a set of number or character (maximum 23 characters) as your **password** and enter it into the Password box.

New Password

Retype New Password

**Step 4.** Select the appropriate TIME ZONE for your location.

### Select Time Zone

---

Select the appropriate time zone for your location.

(GMT+08:00) Taipei

## Quick Start Wizard

---

**Step 5** Select the appropriate Internet connection type to your ISP.

### Connect to the Internet

---

Select one of the following Internet Access type provided by your ISP. If you are not sure which one you should choose, please contact your ISP to get these information in detail.

- ☒ PPPoE
- ☐ PPTP
- ☐ Static IP
- ☐ DHCP

In terms of several Internet connection type, please follow procedures as below:

### **PPPoE Users**

Enter your user name and password provided by your ISP.

### Connect to the Internet

---

Enter the user name and password provided by your ISP.

User Name	<input type="text" value="draytek"/>
Password	<input type="password" value="•••••"/>
Retype Password	<input type="password" value="•••••"/>
Connection Type	
<input type="radio"/> Always On	
<input checked="" type="radio"/> Dial On Demand	
Idle Timeout	<input type="text" value="180"/>

**Dial on Demand:** The router will ONLY connect to your ISP on demand. By “on demand”, it means when any LAN user attempt to send data onto the Internet. When there is no data traffic, the router will close the connection to the ISP because there is no demand.

**Idle timeout:** This is the time setting If there is no Internet traffic for a period, for example 10 minutes.

**Always On:** The router will keep a permanent connection to the ISP automatically.

## Quick Start Wizard

### PPTP users

Enter your user name and password provided by your ISP.

#### Connect to the Internet

Enter the user name, password, WAN IP configurations and PPTP server IP provided by your ISP.

User Name	<input type="text" value="draytek"/>
Password	<input type="password" value="•••••"/>
Retype Password	<input type="password" value="•••••"/>

#### WAN IP Configurations

- ☐ Obtain an IP address automatically  
☒ Specify an IP address

IP Address	<input type="text" value="172"/>	<input type="text" value="16"/>	<input type="text" value="2"/>	<input type="text" value="24"/>
Subnet Mask	<input type="text" value="255"/>	<input type="text" value="255"/>	<input type="text" value="255"/>	<input type="text" value="0"/>
PPTP Server IP	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

**Obtain an IP address automatically:** Set the WAN interface as a DHCP client that will ask for the IP network settings from the DHCP server or PPTP-enabled DSL modem.

**Specify an IP address:** If you are not sure whether there are any DHCP services on the WAN interface, you can manually assign an IP address to the interface. Note that the IP Address and Subnet Mask should be assigned within the same network as the PPTP-enabled DSL modem.

### Static IP

Enter the static (fixed or permanent) IP address that your ISP offers to you.

#### Connect to the Internet

Enter the Static IP configuration provided by your ISP.

WAN IP	<input type="text" value="172"/>	<input type="text" value="16"/>	<input type="text" value="2"/>	<input type="text" value="24"/>
Subnet Mask	<input type="text" value="255"/>	<input type="text" value="255"/>	<input type="text" value="255"/>	<input type="text" value="0"/>
Gateway	<input type="text" value="172"/>	<input type="text" value="16"/>	<input type="text" value="2"/>	<input type="text" value="5"/>
Primary DNS	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Secondary DNS (optional)	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

**WAN IP address:** this is the IP address assigned by your ISP for your router. You shall specify the IP address of the router here, e.g. 172.16.2.84

## Quick Start Wizard

---

**Subnet Mask:** an address code that determines the size of the network; this is the subnet mask of the router, when seen by external users on the Internet (including your ISP). The subnet mask is provided by your ISP. e.g. 255.255.255.0

**Gateway IP Address:** an IP address forwards Internet traffic from your local area network (LAN), e.g. 172.16.2.5

**DNS Server IP address:** you must specify DNS server IP address here if your ISP has the said address. If you do not specify it, the router will automatically apply default DNS Server IP address: 194.109.6.66 to this field.

### DHCP

Some Cable ISPs require user to provide or specify MAC address for access authentication purpose. You can either manually enter the MAC address in the MAC Address fields or clone from your network adapter.

#### Connect to the Internet

---

If your ISP require you to enter a specific host name or specific MAC address, please enter it in. The **Clone MAC Address** button is used to copy the MAC address of your Ethernet adapter to the Vigor2100V.

Host Name  (optional)

MAC 

00	-	50	-	7F	-	27	-	E5	-
42	(optional)								

### Step 6 Review the summary of settings.

#### Summary

---

Please find your settings :

Internet Access : PPPoE

Time Zone : (GMT+08:00) Taipei

Click **Back** to modify changes if necessary. Otherwise, click **Finish** to save the current settings and restart the Vigor2100.

## *Quick Start Wizard*

---

Vigor2100 V models apply efficient codecs designed to make the best use of available bandwidth. Vigor2100 V models also equips with **automatic QoS assurance**. QoS Assurance assists to assign higher priority to voice traffic via Internet for better talking/hearing enjoyment. To achieve that, you will always have the required inbound and outbound bandwidth that is prioritized exclusively for Voice traffic over Internet. Your data will arrive a little bit later in a tolerable manner.

On the bottom of Web Configurator window, you can find messages showing the system interaction with you.

- ♦ **“Ready”** indicates the system is ready for you to input settings.
- ♦ **“Settings Saved”** means your settings are saved once you click “Finish” or “OK” button.

## Chapter 2

# Online Status

## 2.1 Introduction

The **Online Status** provides some useful information about the Vigor router, LAN and WAN interface. Also, you could use the status page to know the Internet access status.

## 2.2 Settings

Click **Online Status** to open the Online Status page.

Here in, we use an example to explain **the Online Status**. In the example, as shown in the following picture, the router is working on Dynamic IP mode to access the Internet.

System Status

LAN Status		Primary DNS	194.109.6.66	Secondary DNS	194.98.0.1
IP Address	192.168.1.1	TX Packets	805	RX Packets	707
WAN Status		GW IP Addr	172.16.2.5		
Mode	Static	IP Address	172.16.2.24	TX Packets	0
	IP			TX Rate	0
				RX Packets	0
				RX Rate	0
				Up Time	0:00:00
>> <a href="#">Dial PPPoE or PPTP</a> >> <a href="#">Drop PPPoE or PPTP</a>					

### 2.2.1 System Status

**System Uptime:** This represents the router's running time. The format is HH:MM:SS, where HH, MM, and SS, indicate hours, minutes, and seconds, respectively.

## 2.2.2 LAN Status

<b>IP Address</b>	IP address of the LAN interface.
<b>TX Packets</b>	Total number of transmitted IP packets since the router was powered on.
<b>RX Packets</b>	Total number of received IP packets since the router was powered on.
<b>Primary DNS</b>	You must specify DNS server IP address here if your ISP has the said address. If you do not specify it, the router will automatically apply default DNS Server IP address: 194.109.6.66 to this field.
<b>Secondary DNS</b>	You must specify secondary DNS server IP address here if your ISP has the said address. If you do not specify it, the router will automatically apply default secondary DNS Server IP address: 194.98.0.1 to this field.

## 2.2.3 WAN Status

<b>Mode</b>	Indicate which broadband access mode is active. Depending upon the access mode, you may see <b>PPPoE</b> , <b>PPTP</b> , <b>PPPoA</b> , or <b>Static IP</b> or <b>DHCP</b> .
<b>GW IP Addr</b>	The gateway IP address.
<b>IP Address</b>	IP address of the WAN interface.
<b>TX Packets</b>	Total number of transmitted IP packets during this connection session.
<b>TX Rate</b>	Transmission rate in characters per second (cps) for outgoing data.
<b>RX Packets</b>	Total number of received IP packets during this connection session.
<b>RX Rate</b>	Reception rate in characters per second (cps) for incoming data.
<b>Up Time</b>	Connection time. The format is HH:MM:SS, where HH, MM, and SS, indicate hours, minutes, and seconds, respectively.
<b>Drop/Dial PPPoE or PPTP</b>	Click the link to dial/or disconnect the PPPoE or PPTP connection.

## **Chapter 3**

# **Internet Access Setup**

---

### **3.1 Introduction**

The router connects the group of PCs in your home or office to the Internet. The router regulates the data that travels between two networks. The Network Address Translation (NAT) of the router translates a public IP address for the Internet to several private IP addresses of a local area network.

IP means Internet Protocol. Every device in an IP-based Network, including routers, print server, and PCs needs an IP address to identify its location on the network. The PPPoE, Dynamic/Static IP and PPTP are three major ways of assigning IP addresses for the Internet to your router. Setup screen and available features differ relying on what kind of connection type your ISP offers.

The router supports the Ethernet WAN interface for Internet access. The following sections will explain more details of various broadband access setups.

Once you already access Internet via the procedure of “Chapter 1 Quick Start Wizard”, you do not need to re-set your settings for Internet connection unless you would like to change your configuration.

## 3.2 Settings

For broadband access, you need to know what kind of Internet access your ISP provides.

Click **Internet Access** to open the Internet access page.

There are four widely used broadband access services, **PPPoE Client**, **PPTP Client**, **Static IP** for DSL, and **Dynamic IP (DHCP Client)** for Cable. In most cases, you will get a DSL or Cable modem from the broadband access service provider.

<b>PPPoE</b>	Some DSL-based ISPs use PPPoE (Point-to-Point Protocol over Ethernet) to let users establish Internet access. All local users can share one PPPoE connection to access the Internet.
<b>Static IP</b>	It means a fixed or permanent IP address. Choose Static IP if your ISP provides you with a permanent IP address.
<b>Dynamic IP</b>	It means that "Obtain an IP automatically". In most circumstances, the cable modem that you are connecting shall obtain a dynamic IP address from the ISP.
<b>PPTP</b>	Some DSL-based ISPs use PPTP (Point-to-Point Tunneling Protocol) to establish Internet connection for users. The PPTP is available in Europe and Israel. As a result, your DSL modem only supports the PPTP tunnel to access the Internet. You shall create a PPTP tunnel that carries a PPP session and terminates on the DSL modem. Once the tunnel has been established, this kind of DSL modem will forward the PPP session to the ISP. As long as the PPP session is connected, all the local users will be able to share this PPP session to access to the Internet.

### 3.2.1 Using PPPoE with a DSL modem

Click **Internet Access Setup > PPPoE** to enter the setup page.

**PPPoE Client Mode**

<b>PPPoE Setup</b> PPPoE Link <input checked="" type="radio"/> Enable <input type="radio"/> Disable <b>ISP Access Setup</b> ISP Name <input type="text" value="draytek"/> Username <input type="text" value="draytek"/> Password <input type="password" value="....."/> Scheduler (1-15) => <input type="text" value="1"/> , <input type="text" value="2"/> , <input type="text"/> , <input type="text"/>	<b>PPP/MP Setup</b> PPP Authentication <input type="text" value="PAP or CHAP"/> <input type="checkbox"/> Always On Idle Timeout <input type="text" value="180"/> second(s) <b>IP Address Assignment Method (IPCP)</b> Fixed IP <input type="radio"/> Yes <input checked="" type="radio"/> No (Dynamic IP) Fixed IP Address <input type="text"/> <b>WAN physical type</b> Auto negotiation <input type="text"/>
--	--

#### PPPoE Setup

**PPPoE Link:** Check **Enable** to enable the PPPoE client protocol on the WAN interface.

Please remember to remove PPPoE applications, which are already installed on your PCs if you need to enable PPPoE and you are DSL users.

#### ISP Access Setup

**ISP Name:** Enter the service name if provided by your ISP.

**Username/Password:** Enter the username and password supplied by your ISP

**Scheduler (1-15):** Enter the index of schedule profile to control the Internet access by time plan.

#### PPP/MP Setup

**PPP Authentication:** Select PAP or CHAP for widest compatibility.

**Always On:** Check to force the Internet access is always online, and you will see the **Idle Timeout** field will be blocked for input.

**Idle Timeout:** Idle timeout means the router will disconnect after

being idle for a preset amount of time. The default is 180 seconds. If you set the time to 0, the PPP session will not terminate itself.

### **IP Address Assignment Method (IPCP)**

**Fixed IP:** Check **No (Dynamic IP)** unless your ISP has provided you with a static IP address.

**Fixed IP Address:** If your ISP has provided you with a static IP address enter it here.

## **3.2.2 Using a Static IP with a DSL/Cable Modem**

You can receive a fixed public IP address or a public subnet (i.e. Multiple public IP addresses) from your DSL or Cable ISP. Because of NAT (Network Address Translation) function, you just need to assign a fixed public IP address to assign to the WAN interface of your router. Your router will let your every PC share the broadband access as NAT transform the said fixed IP address to several private IP address. Click **Internet Access Setup > Static or Dynamic IP** to enter the setup page, which is depicted as follows:

**Static or Dynamic IP (DHCP Client)**

<p><b>Access Control</b></p> <p>Broadband Access <input checked="" type="radio"/> Enable <input type="radio"/> Disable</p> <hr/> <p><b>Keep WAN Connection</b></p> <p><input checked="" type="checkbox"/> Enable PING to keep alive</p> <p>PING to the IP <input type="text" value="172.16.2.23"/></p> <p>PING Interval <input type="text" value="0"/> minute(s)</p> <hr/> <p><b>WAN physical type</b></p> <p>Auto negotiation <input type="button" value="v"/></p>	<p><b>WAN IP Network Settings</b></p> <p><input type="radio"/> Obtain an IP address automatically</p> <p>Router Name <input type="text"/> *</p> <p>Domain Name <input type="text"/> *</p> <p><small>* : Required for some ISPs</small></p> <p><input checked="" type="radio"/> Default MAC Address</p> <p><input type="radio"/> Specify a MAC Address</p> <p>MAC Address: <input type="text" value="00"/> <input type="text" value="50"/> <input type="text" value="7F"/> : <input type="text" value="27"/> <input type="text" value="E5"/> <input type="text" value="42"/></p> <p><input checked="" type="radio"/> Specify an IP address</p> <p>IP Address <input type="text" value="172.16.2.24"/></p> <p>Subnet Mask <input type="text" value="255.255.255.0"/></p> <p>Gateway IP Address <input type="text" value="172.16.2.5"/></p> <hr/> <p><b>DNS Server IP Address</b></p> <p>Primary IP Address : <input type="text"/></p> <p>Secondary IP Address : <input type="text"/></p>
---	--

### **Access Control**

**Broadband Access:** Select **Enable** to turn on the broadband access capability.

### **Keep WAN Connection**

**Enable PING to keep alive:** If you specify “Enable PING to keep alive” function, the router will periodically check your Internet connection. The router will automatically re-establish the connection if the connection is down. Normally, this function is used for Dynamic IP environment. Here will ignore the settings.

### **WAN IP Network Settings**

<b><i>Specify an IP address</i></b>	If your ISP offers you a static (fixed or permanent) IP address, you have to enable “ <b><i>Specify an IP address</i></b> ”.
<b><i>IP address</i></b>	This is the IP address assigned by your ISP for your router. You shall specify the IP address of the router here. e.g. 172.16.2.84.
<b><i>Subnet Mask</i></b>	An address code that determines the size of the network; this is the subnet mask of the router, when seen by external users on the Internet (including your ISP). (Default: 255.255.255.0/ 24)
<b><i>Gateway IP Address</i></b>	An IP address forwards Internet traffic from your local area network (LAN), e.g. 172.16.2.5.
<b><i>DNS Server IP address</i></b>	<p>You must specify a DNS server IP address here because your ISP will at least provide you with at least one DNS Server IP address. If you do not specify it, the router will automatically apply default DNS Server IP address: 194.109.6.66 to this field.</p> <p><b>The Domain Name System (DNS) functions how the Internet translates domain or website names into Internet addresses or URLs.</b></p>

## Internet Access Setup

<b>Secondary DNS Server IP address</b>	You must specify secondary DNS server IP address here because your ISP often can let you have at least one DNS Server IP address. If you do not specify it, the router will automatically apply default secondary DNS Server IP address: 194.98.0.1 to this field.
--	--

The default DNS Server IP address can be found via Online Status:

### System Status

				System Uptime: 0:9:33		
LAN Status		Primary DNS 194.109.6.66		Secondary DNS 194.98.0.1		
IP Address		TX Packets		RX Packets		
192.168.1.1		805		707		
WAN Status		GW IP Addr 172.16.2.5				
Mode	IP Address	TX Packets	TX Rate	RX Packets	RX Rate	Up Time
Static IP	172.16.2.24	0	0	0	0	0:00:00
>> <a href="#">Dial PPPoE or PPTP</a> >> <a href="#">Drop PPPoE or PPTP</a>						

### 3.2.3 Using a Dynamic IP (DHCP Client) with a DSL/Cable Modem

This application is mostly used by Cable ISPs. Click **Internet Access Setup > Static or Dynamic IP** to enter the setup page.

**Static or Dynamic IP (DHCP Client)**

<p><b>Access Control</b></p> <p>Broadband Access <input checked="" type="radio"/> Enable <input type="radio"/> Disable</p> <hr/> <p><b>Keep WAN Connection</b></p> <p><input checked="" type="checkbox"/> Enable PING to keep alive</p> <p>PING to the IP <input type="text" value="0.0.0.0"/></p> <p>PING Interval <input type="text" value="0"/> minute(s)</p> <hr/> <p><b>WAN physical type</b></p> <p>Auto negotiation ▼</p>	<p><b>WAN IP Network Settings</b></p> <p><input checked="" type="radio"/> Obtain an IP address automatically</p> <p>Router Name <input type="text"/> *</p> <p>Domain Name <input type="text"/> *</p> <p>* : Required for some ISPs</p> <p><input checked="" type="radio"/> Default MAC Address</p> <p><input type="radio"/> Specify a MAC Address</p> <p>MAC Address: <input type="text" value="00"/> <input type="text" value="50"/> <input type="text" value="7F"/> : <input type="text" value="27"/> <input type="text" value="E5"/> <input type="text" value="42"/></p> <p><input type="radio"/> Specify an IP address</p> <p>IP Address <input type="text" value="0.0.0.0"/></p> <p>Subnet Mask <input type="text" value="255.255.255.0"/></p> <p>Gateway IP Address <input type="text"/></p> <hr/> <p><b>DNS Server IP Address</b></p> <p>Primary IP Address : <input type="text"/></p> <p>Secondary IP Address : <input type="text"/></p>
--	--

#### Access Control

**Broadband Access:** Select **Enable** to turn on the broadband access capability.

#### Keep WAN Connection

**Enable PING to keep alive:** Check to enable PING to keep alive function. Normally, this function is for Dynamic IP environment. If you need to enable the function, assign a public IP address in the PING to the IP and a timer in the PING Interval.

## *Internet Access Setup*

---

### **WAN IP Network Settings**

<b><i>Obtain an IP address automatically</i></b>	The option must be enabled.
<b><i>Router Name</i></b>	Depending on your Cable ISP, this option may or may not be left blank. Some ISPs require this name for access authentication.
<b><i>Domain Name</i></b>	Depending on your Cable ISP this field may or may not be left blank.
<b><i>Default MAC Address &amp; Specify a MAC Address</i></b>	These two options are mutually exclusive. Some Cable ISPs use a specific MAC address for access authentication. In such cases you need to check the <b>Specify a MAC Address box</b> and enter the MAC address in the MAC Address fields. Click <b>OK</b> and restart the router to allow the settings to take affect.

### 3.2.4 Using PPTP with a DSL Modem

Click **Internet Access Setup > PPTP** to enter the setup page, as shown below. Herein, we use an example to explain the corresponding setting. Your DSL service provider should provide the exact settings.

**PPTP Client Mode**

<b>PPTP Setup</b> PPTP Link <input checked="" type="radio"/> Enable <input type="radio"/> Disable PPTP Server <input type="text" value="61.152.23.2"/> <b>ISP Access Setup</b> ISP Name <input type="text" value="draytek"/> Username <input type="text" value="draytek"/> Password <input type="password" value="....."/> Scheduler (1-15) => <input type="text" value="1"/> , <input type="text" value="2"/> , <input type="text"/> , <input type="text"/>	<b>PPP Setup</b> PPP Authentication <input type="text" value="PAP or CHAP"/> <input checked="" type="checkbox"/> Always On Idle Timeout <input type="text" value="-1"/> second(s) <b>IP Address Assignment Method (IPCP)</b> Fixed IP <input type="radio"/> Yes <input checked="" type="radio"/> No (Dynamic IP) Fixed IP Address <input type="text"/> <b>LAN2/WAN IP Network Settings</b> <input type="radio"/> Obtain an IP address automatically <input checked="" type="radio"/> Specify an IP address IP Address <input type="text" value="172.16.2.24"/> Subnet Mask <input type="text" value="255.255.255.0"/> <b>WAN physical type</b> <input type="text" value="Auto negotiation"/>
--	---

#### PPTP Setup

<b>PPTP Link</b>	Check <b>Enable</b> to enable a PPTP client to establish a tunnel to a DSL modem on the WAN interface.
<b>PPTP Server IP Address</b>	Specify the IP address of the PPTP-enabled DSL modem. Refer to the user manual of the PPTP-enabled DSL modem.

#### ISP Access Setup

**ISP Name:** Enter the service name if provided by your ISP.

**Username/Password:** Enter the username and password supplied by your ISP.

**Scheduler (1-15):** Enter the index of schedule profile to control the Internet access by time plan.

## *Internet Access Setup*

---

### **PPP/MP Setup**

<b><i>PPP Authentication</i></b>	Select PAP or CHAP for widest compatibility.
<b><i>Always On</i></b>	Check to force the Internet access is always online, and you will see the Idle Timeout field will be blocked for input.
<b><i>Idle Timeout</i></b>	Idle timeout means the router will disconnect after being idle for a preset amount of time. The default is 180 seconds. If you set the time to 0, the PPP session will not terminate itself.
<b><i>IP Address Assignment Method (IPCP)</i></b>	<b><i>Fixed IP:</i></b> Check No (Dynamic IP) unless your ISP has provided you with a static IP address.  <b><i>Fixed IP Address:</i></b> If your ISP has provided you with a fixed IP address enter it here.

### **WAN IP Network Settings**

<b><i>Obtain an IP address automatically</i></b>	Set the WAN interface as a DHCP client that will ask for the IP network settings from the DHCP server or PPTP-enabled DSL modem.
<b><i>Specify an IP address</i></b>	If you are not sure whether there are any DHCP services on the WAN interface, you can manually assign an IP address to the interface. Note that the IP Address and Subnet Mask should be assigned within the same network as the PPTP-enabled DSL modem.

## Chapter 4 LAN Setup

### 4.1 Introduction

In this chapter, we will explain about the **LAN Setup**.

### 4.2 Settings

Click **LAN** to open the LAN settings page.

#### 4.2.1 LAN TCP/IP and DHCP

Ethernet TCP/IP and DHCP Setup	
<b>LAN IP Network Configuration</b>	
For NAT Usage	
IP Address	: 192.168.1.1
Subnet Mask	: 255.255.255.0
<b>DHCP Server Configuration</b>	
<input checked="" type="radio"/> Enable Server <input type="radio"/> Disable Server	
Relay Agent: <input type="radio"/> 1st Subnet	
Start IP Address	: 192.168.1.10
IP Pool Counts	: 50
Gateway IP Address	: 192.168.1.1
DHCP Server IP Address for Relay Agent	:
<b>DNS Server IP Address</b>	
Primary IP Address	:
Secondary IP Address	:

#### LAN IP Network Configuration

The IP address/subnet mask is for grouping users on your LAN. For example, you can let the computer of your kids be connected together with your own computer to share the broadband access and to share files.

***For NAT Usage: (Default: Always Enable)***

**LAN IP Network Configuration**  
For NAT Usage  
IP Address : 192.168.1.1  
Subnet Mask : 255.255.255.0

**IP Address:** Private IP address for connecting to a local private network (Default: 192.168.1.1).

**Subnet Mask:** An address code that determines the size of the network; this is the subnet mask of the router, when seen by external users on the Internet (including your ISP).

(Default: 255.255.255.0/ 24)

**DHCP Server Configuration**

DHCP stands for Dynamic Host Configuration Protocol. The router by factory default acts a DHCP server for your network. The router can hence automatically dispatch related IP settings to any local user configured as a DHCP client.

It is highly recommended that you leave the router enabled as a DHCP server if you do not have a DHCP server for your network.

Please refer to the following picture for DHCP Server Configuration.

## LAN Setup

**DHCP Server Configuration**  
☒ Enable Server ☐ Disable Server  
Relay Agent: ☐ 1st Subnet  
Start IP Address :   
IP Pool Counts :   
Gateway IP Address :   
DHCP Server IP Address for Relay Agent :   
**DNS Server IP Address**  
Primary IP Address :   
Secondary IP Address :

<b>Enable Server</b>	Let the router automatically assign IP address to every PC on the LAN
<b>Disable Server</b>	You manually assign IP address from the router to every PC on the LAN
<b>Relay Agent</b>	Allows PCs on the LAN to request IP address from other DHCP server, e.g. You shall get IP from the DHCP server located at your office.
<b>Start IP Address</b>	Set the start IP address of the IP address pool.
<b>IP Pool Counts</b>	Set the number of IP address pool.
<b>Gateway IP Address</b>	Sets the gateway IP address for the DHCP server. Usually, it should be the same as the said IP address when the router works as a default gateway.
<b>Start IP Address</b>	Set the start IP address of the IP address pool.
<b>DNS Server IP Address</b> <b>(Default: None)</b>	DNS stands for Domain Name System. Every Internet host must have a unique IP address, also they may have a human-friendly, easy to remember name such as www.yahoo.com. The DNS server converts the user-friendly name into its equivalent IP address.
<b>Primary IP Address</b>	You must specify a DNS server IP address here because your ISP will at least provide you with at least one DNS Server IP address. If you do not specify it, the router will

## LAN Setup

	automatically apply default DNS Server IP address: 194.109.6.66 to this field.
<b>Secondary IP Address</b>	You must specify secondary DNS server IP address here because your ISP often can let you have at least one DNS Server IP address. If you do not specify it, the router will automatically apply default secondary DNS Server IP address: 194.98.0.1 to this field.

The default DNS Server IP address can be found via Online Status:

### System Status

		System Uptime: 0:9:33			
<b>LAN Status</b>		<b>Primary DNS</b>	194.109.6.66	<b>Secondary DNS</b>	194.98.0.1
	<b>IP Address</b>	<b>TX Packets</b>	<b>RX Packets</b>		
	192.168.1.1	805	707		
<b>WAN Status</b>		<b>GW IP Addr</b>	172.16.2.5		
<b>Mode</b>	<b>IP Address</b>	<b>TX Packets</b>	<b>TX Rate</b>	<b>RX Packets</b>	<b>RX Rate</b>
Static IP	172.16.2.24	0	0	0	0
				<b>Up Time</b>	0:00:00
		>> <a href="#">Dial PPPoE or PPTP</a> >> <a href="#">Drop PPPoE or PPTP</a>			

If both the Primary IP and Secondary IP Address fields are left empty, the router will assign its own IP address to local users as a DNS proxy server and maintain a DNS cache. If the IP address of a domain name is already in the DNS cache, the router will resolve the domain name immediately. Otherwise, the router forwards the DNS query packet to the external DNS server by establishing a WAN (e.g. DSL/Cable) connection.

## Chapter 5

# NAT Setup

---

### 5.1 Introduction

NAT is a method of mapping one or more IP addresses and/or service ports into different specified services, where NAT stands for Network Address Translation. It allows the internal IP addresses of many computers on a Local Area Network (LAN) to be translated to one public address, saving users' cost. It also plays a security role by obscuring the true IP addresses of important machines from potential hackers on the Internet. For convenience, we called a router having the NAT facility as a NAT-enabled router.

Usually you will use your Vigor router as a NAT-enabled router. The NAT-enabled router gets one globally re-routable IP address from the ISP and assigns private network IP addresses defined by RFC-1918 to local hosts. The NAT-enabled router translates the private network IP addresses to such a globally routable IP address so that local hosts can communicate with the router and access the Internet.

### 5.2 Settings

Click **NAT Setup** to open the setup page.

On the page, you will see the private IP address defined in RFC-1918. Usually we use the 192.168.1.0/24 subnet for the router. Also, as stated before, the NAT facility can map one or more IP addresses

and/or service ports into different specified services. In other words, the NAT function can be achieved by using port mapping method.

In the Vigor routers, we support three variants of port mapping methods:

**Port Redirection, Open Ports, and DMZ host**

<b>Port Redirection</b>	The packet is forwarded to a specific local host if the port number matches that defined in the table. A user can also translate the port to another port locally.
<b>Open Ports</b>	Similar to the Port Redirection, the Open Ports facility also supports users to define a range of ports.
<b>DMZ host</b>	This opens up a single host completely. All incoming packets will be forwarded to the host with the local IP address you designated. The only exception is packets received in response to outgoing requests from other local computers or incoming packets that match rules in the other two methods.

It should be noticed that, while you are using combinations of these three systems, there is a priority structure. That is, if a rule in one method conflicts with a rule in another method, then there is strict precedence. This leads to a predictable result and resolution of rule-conflict. The precedence is defined as follows.

**Port Redirection > Open Ports > DMZ host**

**Example:** If the port number of an incoming packet matches a rule specified in both **Port Redirection** and **Open Ports**, then the packet will be forwarded to the local address designated in **Port Redirection**.

Now, let us move on individual setting of these three port-mapping methods.

### 5.2.1 Port Redirection Table

The **Port Redirection** is for you to expose internal servers to the public domain. For example, you run a web server and some users want to access this web server. You also run an internal SMTP mail server for your home office and you shall allow your ISP to send whole E-mail to your SMTP mail server. Consequently, you assign different port number on the **Port Redirection Table** to different services such as http, smtp, ftp etc. External users, i.e. people elsewhere on the Internet can then access your web server via your public IP address. Even if your public IP address is a dynamic IP address, you can apply the Dynamic DNS service to obtain an online WAN IP address (such as hostnmae.dyndns.org) where is able to be mapped to your current dynamic IP address. Any external user can visit your web server simply via your online WAN IP address.

The following example shows how an internal FTP server is exposed to the public domain. The internal FTP server is running on the local host addressed as 192.168.1.10.

**Port Redirection Table**

Index	Service Name	Protocol	Public Port	Private IP	Private Port	Active
1	FTP	TCP	21	192.168.1.10	21	<input checked="" type="checkbox"/>
2		---	0		0	<input type="checkbox"/>
3		---	0		0	<input type="checkbox"/>
4		---	0		0	<input type="checkbox"/>
5		---	0		0	<input type="checkbox"/>
6		---	0		0	<input type="checkbox"/>
7		---	0		0	<input type="checkbox"/>
8		---	0		0	<input type="checkbox"/>
9		---	0		0	<input type="checkbox"/>
10		---	0		0	<input type="checkbox"/>

As shown above, the **Port Redirection Table** provides 10 port-mapping entries for internal hosts.

## NAT Setup

<b>Service Name</b>	Specify the name for the specific network service.
<b>Protocol</b>	Specify the transport layer protocol (TCP or UDP).
<b>Public Port</b>	Specify which port should be redirected to the internal host.
<b>Private IP</b>	Specify the private IP address of the internal host offering the service.
<b>Private Port</b>	Specify the private port number of the service offered by the internal host.
<b>Active</b>	Check here to activate the port-mapping entry.

Because the router has its own built-in web server for the configuration, if you want to access to the Web Configurator remotely and to a web server behind the router, you need to change the router's http "port" to something other than the **default port 80**. You shall change the admin port from the **Management Setup** menu and you then access the admin screen by suffixing the normal IP address of Vigor router's Web Configurator with 8080, e.g. **http://192.168.1.1:8080**

System Maintenance >> Management Setup

**Management Setup**

**Management Access Control**

- ☐ Enable remote firmware upgrade(FTP)
- ☐ Allow management from the Internet
- ☒ Disable PING from the Internet

**Access List**

List	IP	Subnet Mask

**Management Port Setup**

☐ Default Ports (Telnet:23, HTTP:80, FTP:21)

☒ User Define Ports

Telnet Port :

HTTP Port :

FTP Port :

The port redirection can only be applied to external users only - i.e. the incoming traffic. The Internet users behind your LAN can not access your external public IP address and come back in; the internal users shall access the server on its local private IP address, or you can set up an alias in a Windows hosts file. Please only redirect the ports you know you have to forward rather than forward all ports. Otherwise, you will compromise the firewall-type security initially deployed by the NAT facility.

### 5.2.2 DMZ Host Setup

The **Port Redirection** can direct UDP/TCP traffic on particular ports to specified internal clients on the LAN. However, other IP protocols, for example Protocols 50 (ESP) and 51 (AH) do not have port numbers so you cannot decide which local client to forward the data to. Vigor router has a facility called DMZ host that you can specify a single local client (with private IP address) to which ALL unsolicited data on all protocols shall be forwarded. Regular web surfing and other such Internet activities from other clients will continue to work without inappropriate interruption.

The inherent security properties of NAT are somewhat bypassed if you set up DMZ host. You can consider adding additional filter rules or a secondary firewall.

Click **DMZ Host Setup** to open the setup page, as shown below. The DMZ Host setting allows a defined internal user to be exposed to the Internet in order to use some special purpose applications such as Netmeeting or Internet Games etc. Each item in the setup page is described below.

<b>Enable</b>	Check to enable the DMZ Host function.
<b>Private IP</b>	Enter the private IP address of the DMZ host.
<b>Choose PC</b>	Click this button and then a window will automatically pop up, as depicted below. The window consists of a list of private IP addresses of all hosts in your LAN network. Select one private IP address in the list to be the DMZ host.

## NAT Setup

<b>Index</b>	Indicate the relative number for the particular entry that you want to offer service in a local host. You should click the appropriate index number to edit or clear the corresponding entry.
<b>Comment</b>	Specify the name for the defined network service.
<b>Local IP Address</b>	Display the private IP address of the local host offering the service.
<b>Status</b>	Display the state for the corresponding entry. We use X or V to represent the Inactive or Active state.

As stated above, after you click one index number, say index No. 1, in the above figure, you will see the following setup page for the entry with index No. 1. Further, each entry (local host) can specify 10 port-ranges for diverse services. More details for individual items in the setup page are described below.

**Index No. 1**

☒ Enable Open Ports

Comment

Local Computer

	Protocol	Start Port	End Port		Protocol	Start Port	End Port
1.	TCP	6005	6006	6.	----	0	0
2.	----	0	0	7.	----	0	0
3.	----	0	0	8.	----	0	0
4.	----	0	0	9.	----	0	0
5.	----	0	0	10.	----	0	0

<b>Enable Open Ports</b>	Check to enable the Open Port function for this entry.
<b>Comment</b>	Specify the name for the defined network service.
<b>Local Computer</b>	Enter the private IP address of the local host.
<b>Choose PC</b>	Click this button and, subsequently, a window having a list of private IP addresses of local hosts will automatically pop up. Select one appropriate IP address of the local host in the list.

## *NAT Setup*

---

<b>Protocol</b>	Specify the transport layer protocol. It could be TCP, UDP, or NONE for selection.
<b>Start Port</b>	Specify the starting port number of the service offered by the local host.
<b>End Port</b>	Specify the ending port number of the service offered by the local host.

### 5.2.4 Well-known Port Number List

This page provides some well-known port numbers for your reference.

**Well-Known Ports List**

Service/Application	Protocol	Port Number
File Transfer Protocol (FTP)	TCP	21
SSH Remote Login Protocol (ex. pcAnyWhere)	UDP	22
Telnet	TCP	23
Simple Mail Transfer Protocol (SMTP)	TCP	25
Domain Name Server (DNS)	UDP	53
WWW Server (HTTP)	TCP	80
Post Office Protocol ver.3 (POP3)	TCP	110
Network News Transfer Protocol (NNTP)	TCP	119
Point-to-Point Tunneling Protocol (PPTP)	TCP	1723
pcANYWHEREdata	TCP	5631
pcANYWHEREstat	UDP	5632
WinVNC	TCP	5900

## Chapter 6

# Firewall Setup

---

### 6.1 Introduction

Security is top priority to be taken into consideration as the users of broadband line demands more bandwidth for multimedia, interactive applications, or distance learning. The Firewall function helps protect your local network against attack from unauthorized outsiders. It also provides a way of restricting users on the local network from accessing the Internet. Additionally, it can filter out specific packets to trigger the router to place an outgoing connection.

Basic security is that you are recommended to set user name and password to your router when you install your router. The administrator login will prevent unauthorized access to the router configuration from your router.

#### Steps

1. Enter login password
2. Select Time Zone
3. Connect to the Internet
4. Summary

#### Enter login password

There is no default password. For security, please choose a set of number or character (maximum 23 characters) as your **password** and enter it into the Password box.

New Password

Retype New Password

## Firewall Setup

---

Even your installation is not set with password; you can still enter system maintenance to set up your password.

System Maintenance >> Administrator Password Setup

### Administrator Password

Old Password	:	<input type="password"/>
New Password	:	<input type="password"/>
Retype New Password	:	<input type="password"/>

The users on the LAN are provided with secured protection by means of following firewall facilities:

- IP Filter
- Stateful Packet Inspection: tracks packets and denies unsolicited incoming data
- Selectable DoS/DDoS protection
- User-configurable packet filter

When you would like to activate SPI (Stateful Packet Inspection), please follow the path: Firewall>Edit Filter Rule>Keep State

## 6.2 Settings

Click **Firewall Setup** to open the setup page.

## *Firewall Setup*

---

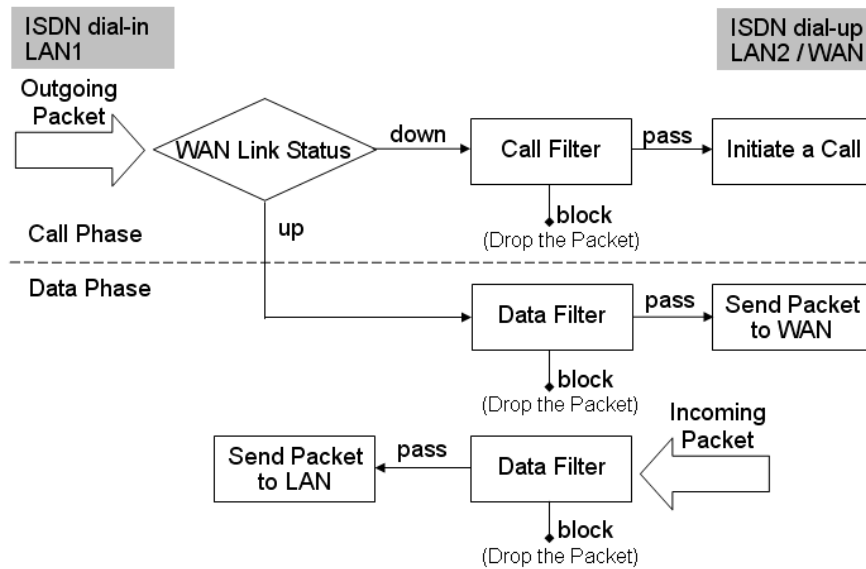

<b>General Setup</b>	Some general settings of Call Filter and Data Filter are available from this link.
<b>Filter Setup</b>	Here are 12 filter sets for IP Filter configurations.
<b>Dos Defense</b>	Click it to set up the DoS defense facility for detecting and mitigating the DoS attacks.
<b>URL Content Filter</b>	Here provides the capability of blocking inappropriate web sites to protect child in school or at home.

The **General Setup** function contains, by default, two types of filter sets: Call Filter set and Data Filter set. The Call Filter is used for users that attempt to establish a connection from LAN side to the Internet. The Data Filter set is used to determine what kind of IP packets is allowed to pass through the router when the WAN connection has been established.

Conceptually, when an outgoing packet is to be routed to the WAN, the IP Filter will decide if the packet should be forwarded to the Call Filter or Data Filter. If the WAN link is down, the packet will enter the Call Filter. If the packet is not allowed to trigger router dialing, it will be dropped. Otherwise, it will initiate a call to establish the WAN connection.

If the WAN link of the router is up, the packet will pass through the Data Filter. If the packet type is set to be blocked, it will be dropped. Otherwise, it will be sent to the WAN interface. Alternatively, if an incoming packet enters from the WAN interface, it will pass through the Data Filter directly. If the packet type is set to be blocked, it will be dropped. Otherwise, it will be sent to the internal LAN. The filter architecture is shown below.

## Firewall Setup

The following sections will explain the settings in conjunction with the **General Setup** and **Filter Setup**. The Vigor router provides 12 filter sets with 7 filter rules for each set. As a result, there are a total of 84 filter rules for the **Filter Setup**.

### Firewall >> Filter Setup

Filter Set 1		Filter Setup		
Comments : Default Call Filter		Set	Comments	Set
Filter Rule	Active	1.	Default Call Filter	7.
1	<input checked="" type="checkbox"/>	2.	Default Data Filter	8.
2	<input type="checkbox"/>	3.		9.
3	<input type="checkbox"/>	4.		10.
4	<input type="checkbox"/>	5.		11.
5	<input type="checkbox"/>	6.		12.
6	<input type="checkbox"/>			
7	<input type="checkbox"/>			

a total of 84 filter rules for the **Filter Setup**

By default, the Call Filter rules are defined in Filter Set 1 and the Data Filter rules are defined in Filter Set 2.

## Firewall Setup

### General Setup

#### Call Filter

- ☒ Enable  
☐ Disable

#### Data Filter

- ☒ Enable  
☐ Disable

Start Filter Set Set#2 ▼

The **DoS Defense** functionality helps you to detect and mitigate the DoS attack. Those attacks include the flooding-type attacks and the vulnerability attacks. The flooding-type attacks attempt to use up all your system's resource while the vulnerability attacks try to paralyze the system by offending the vulnerabilities of the protocol or operation system.

The DoS Defense Engine inspects each incoming packet against the attack signature database. Any packet that may paralyze the host in the security zone is blocked and a Syslog message is sent to the client. Also the DoS Defense Engine monitors the traffic behavior. Any odd situation violating the administrator's configuration is reported and the corresponding defense function is performed in order to mitigate the attack.

The DoS/DDoS defense function can detect and protect the following attacks:

1. SYN flood attack
2. UDP flood attack
3. ICMP flood attack
4. TCP Flag scan
5. Trace route
6. IP options
7. Unknown protocol
8. Land attack
9. Smurf attack
10. SYN fragment
11. ICMP fragment
12. Tear drop attack
13. Fraggle attack
14. Ping of Death attack
15. TCP/UDP port scan

**URL content filter** systems are seen as tools that would provide the cyberspace equivalent of the physical separations that are used to limit access to some particular materials. In rating a site as objectionable, and refusing to display it on the user's computer screen, URL content filtering facilities can be used to prevent children from seeing material that their parents find objectionable. In preventing access, the URL content filtering facility acts as an automated version of the convenience-store clerk who refuses to sell adult magazines to high-school students. The URL content filtering facilities are also used by businesses to prevent employees from accessing Internet resources that are either not related to job content or otherwise deemed inappropriate.

The name of the URL content filtering comes from checking the content of the URL strings. Traditional firewall inspects packets based on the fields of TCP/IP headers, while the URL content filtering checks the URL strings or the payload of TCP/IP packets. In the Vigor routers, the URL content filtering facility inspects the URL string and some of HTTP data hiding in the payload of TCP packets.

## 6.2.1 General Setup

In the General Setup page you can enable/disable the Call Filter or Data Filter and assign a Start Filter Set for each, configure the log settings, and set a MAC address for the logged packets to be duplicated to.

Firewall >> General Setup

**General Setup**

<b>Call Filter</b>	<input checked="" type="radio"/> Enable <input type="radio"/> Disable	Start Filter Set <span>Set#1</span>
<b>Data Filter</b>	<input checked="" type="radio"/> Enable <input type="radio"/> Disable	Start Filter Set <span>Set#2</span>
<b>Log Flag</b>	<span>None</span>	
<b>MAC Address for Logged Packets Duplication</b> 0x <span>000000000000</span>		
<input checked="" type="checkbox"/> Accept Incoming Fragmented UDP Packets ( for some games, ex. CS )		

Some on-line games (for example: Half Life) will use UDP packets with large length to transfer data. These large UDP packets need to be fragmented. As secure firewall, Vigor router will reject these kinds of packets to avoid to be attacked by outside hackers if you do not enable "Accept Incoming Fragmented UDP Packets". You can enable "Accept Incoming fragmented UDP Packet" function to accept these kinds of packets. Then you can play these kinds of on-line games. If you take security concern as high priority, you shall disable "Accept Incoming Fragmented UDP Packets".

### Call Filter

Check **Enable** to activate the Call Filter function. Assign a start filter set for the Call Filter.

## *Firewall Setup*

---

### **Data Filter**

Check **Enable** to activate the Data Filter function. Assign a start filter set for the Data Filter.

### **Log Flag**

For troubleshooting needs you can specify the filter log here.

<b><i>None</i></b>	The log function is inactive.
<b><i>Block</i></b>	All blocked packets will be logged.
<b><i>Pass</i></b>	All passed packets will be logged.
<b><i>No Match</i></b>	The log function will record all packets that are matched.

The filter log will be displayed on the Telnet terminal when you type the “log -f” command.

### **MAC Address for Packet Duplication**

Logged packets may also be logged to another location via Ethernet. If you want to duplicate logged packets from the router to another network device, you must enter the other devices’ MAC Address (HEX Format). Type “0” to disable the feature. The feature will be helpful under Ethernet environments.

## 6.2.2 Filter Setup

### Editing Filter Sets

Firewall >> Filter Setup

**Filter Set 1**

Comments : Default Call Filter

Filter Rule	Active	Comments
1	<input checked="" type="checkbox"/>	Block NetBios
2	<input type="checkbox"/>	
3	<input type="checkbox"/>	
4	<input type="checkbox"/>	
5	<input type="checkbox"/>	
6	<input type="checkbox"/>	
7	<input type="checkbox"/>	

Next Filter Set None

#### Comments

Enter filter set comments/description. Maximum length is 23-character long.

#### Filter Rules

Click a button numbered 1 ~ 7 to edit the filter rule.

#### Active

Enable or disable the filter rule.

#### Next Filter Set

Specifies the next filter set to be linked behind the current filter set. The filters cannot be looped.

### Editing Filter Rules

Click the Filter Rule index button to enter the Filter Rule setup page for each filter. The following explains each configurable item in detail.

## Firewall Setup

### Firewall >> Edit Filter Rule

#### Filter Set 1 Rule 7

Comments :

☒ Check to enable the Filter Rule

Pass or Block <div>Pass Immediately</div>		Branch to Other Filter Set <div>None</div>			
<input type="checkbox"/> Duplicate to LAN		<input type="checkbox"/> Log			
Direction <div>OUT</div>		Protocol <div>any</div>			
	IP Address	Subnet Mask	Operator	Start Port	End Port
Source	<div>any</div>	<div>255.255.255.255 (/32)</div>	<div>=</div>	<div></div>	<div></div>
Destination	<div>any</div>	<div>255.255.255.255 (/32)</div>	<div>=</div>	<div></div>	<div></div>
<input type="checkbox"/> Keep State		Fragments <div>Don't Care</div>			

### Comments

Enter filter set comments/description. Maximum length is 14-character long.

### Check to enable the Filter Rule

Enables the filter rule.

### Pass or Block

Specifies the action to be taken when packets match the rule.

<b>Block Immediately</b>	Packets matching the rule will be dropped immediately.
<b>Pass Immediately</b>	Packets matching the rule will be passed immediately.
<b>Block If No Further Match</b>	A packet matching the rule, and that does not match further rules, will be dropped.
<b>Pass If No Further Match</b>	A packet matching the rule, and that does not match further rules, will be passed through.

### **Branch to other Filter Set**

If the packet matches the filter rule, the next filter rule will branch to the specified filter set.

### **Duplicate to LAN**

If you want to log the matched packets to another network device, check this box to enable it.

The MAC Address of the specified network device or PC is defined in **Firewall >>general Setup >> MAC Address for Logged Packets Duplication.**

#### **MAC Address for Logged Packets Duplication**

0x

### **Log**

Check this box to enable the log function. Use the Telnet command **log-f** to view the logs.

### **Direction**

Sets the direction of packet flow. For the Call Filter, this setting is irrelevant.

### **Keep State and Fragments (for Data Filter only)**

These should be accompanied by the below settings also.

**IN:** Specify the rule for filtering incoming packets.

**OUT:** Specify the rule for filtering outgoing packets.

**Protocol:** Specify the protocol(s) this filter rule will apply to.

**IP Address:** Specify a source and destination IP address for this filter rule to apply to. Place the symbol “!” before a particular IP Address will prevent this rule from being applied to that IP address. It is equal to the logical NOT operator.

**Subnet Mask:** Specify the Subnet Mask for the IP Address column for

## Firewall Setup

this filter rule to apply to.

**Operator:** The operator column specifies the port number settings. If the **Start Port** is empty, the **Start Port** and the **End Port** column will be ignored. The filter rule will filter out any port number.

**=** : If the **End Port** is empty, the filter rule will set the port number to be the value of the **Start Port**. Otherwise, the port number ranges between the **Start Port** and the **End Port** (including the **Start Port** and the **End Port**).

**!=** : If the **End Port** is empty, the port number is not equal to the value of the **Start Port**. Otherwise, this port number is not between the **Start Port** and the **End Port** (including the **Start Port** and **End Port**).

**>** : Specify the port number is larger than the **Start Port** (includes the **Start Port**).

**<** : Specify the port number is less than the **Start Port** (includes the **Start Port**).

**Keep State:** i.e. **Stateful Packet Inspection**. It tracks packets and denies unsolicited incoming data. On the protocol entry, you can choose TCP or UDP or TCP/UDP or ICMP.

Filter Set 1 Rule 2

Comments :

☒ Check to enable the Filter Rule

Pass or Block <input type="button" value="Block Immediately"/>		Branch to Other Filter Set <input type="button" value="None"/>	
<input type="checkbox"/> Duplicate to LAN		<input type="checkbox"/> Log	
Direction <input type="button" value="OUT"/>		Protocol <input type="button" value="any"/>	
IP Address		Subnet Mask	
Source	<input type="text" value="any"/>	<input type="text" value="255.255.255.255 (/32)"/>	<input type="text" value="any"/>
Destination	<input type="text" value="any"/>	<input type="text" value="255.255.255.255 (/32)"/>	<input type="text" value="any"/>
<input checked="" type="checkbox"/> Keep State		Fragments <input type="button" value="Don't Care"/>	

## Firewall Setup

**Fragments:** Specify a fragmented packets action.

<b>Don't care</b>	Specify no fragment options in the filter rule.
<b>Unfragmented</b>	Apply the rule to unfragmented packets.
<b>Fragmented</b>	Apply the rule to fragmented packets.
<b>Too Short</b>	Apply the rule only to packets that are too short to contain a complete header.

### An Example of Restricting Unauthorized Internet Services

This section will show a simple example to restrict someone from accessing WWW services. In this example, we assume the IP address of the access-restricted user is 192.168.1.10. The filter rule is created in the Data Filter set and is shown as below. Port 80 is the HTTP protocol port number for WWW services.

Firewall >> Edit Filter Rule

Filter Set 2 Rule 2

Comments :

Destination	any	255.255.255.255 (/32)	=	80	

☐ Keep State

Fragments ☐ Don't Care

### 6.2.3 DoS (Denial of Service) Defense

The following sections will explain in more detail about DoS Defense Setup by using the Web Configurator. It is a sub-functionality of IP Filter/Firewall. There are a total of 15 kinds of defense function for the DoS Defense Setup. By default, the DoS Defense functionality is disabled. Further, once the DoS Defense functionality is enabled, the

## *Firewall Setup*

---

default values for the threshold and timeout values existing in some functions are set to 300 packets per second and 10 seconds, respectively. A brief description for each item in the DoS defense function is shown below.

**DoS defense Setup**

<input checked="" type="checkbox"/> Enable DoS Defense	
<input checked="" type="checkbox"/> Enable SYN flood defense	Threshold <input type="text" value="300"/> packets / sec Timeout <input type="text" value="10"/> sec
<input checked="" type="checkbox"/> Enable UDP flood defense	Threshold <input type="text" value="300"/> packets / sec Timeout <input type="text" value="10"/> sec
<input checked="" type="checkbox"/> Enable ICMP flood defense	Threshold <input type="text" value="300"/> packets / sec Timeout <input type="text" value="10"/> sec
<input type="checkbox"/> Enable Port Scan detection	Threshold <input type="text" value="300"/> packets / sec
<input type="checkbox"/> Block IP options	<input type="checkbox"/> Block TCP flag scan
<input type="checkbox"/> Block Land	<input type="checkbox"/> Block Tear Drop
<input type="checkbox"/> Block Smurf	<input type="checkbox"/> Block Ping of Death
<input type="checkbox"/> Block trace route	<input type="checkbox"/> Block ICMP fragment
<input type="checkbox"/> Block SYN fragment	<input type="checkbox"/> Block Unknown Protocol
<input type="checkbox"/> Block Fraggle Attack	

Defend ICMP flood attack to make the server resource available for legitimate users.

### **Enable Dos Defense**

Click the checkbox to activate the DoS Defense Functionality.

### **Enable SYN flood defense**

Click the checkbox to activate the SYN flood defense function. If the amount of the TCP SYN packets from the Internet exceeds the user-defined threshold value, the Vigor router will be forced to discard randomly the sequent TCP SYN packets in the user-defined timeout period. The main goal is to protect the Vigor router against the TCP SYN packets that intend to use up the router's limited-resource. By default, the threshold and timeout values are set to 300 packets per second and 10 seconds, respectively.

### **Enable UDP defense**

Click the checkbox to activate the UDP flood defense function. Once the UDP packets from the Internet exceed the user-defined threshold value, the router will be forced to discard all sequent UDP packets in the user-defined timeout period. The default setting for threshold and timeout are 300 packets per second and 10 seconds, respectively.

### **Enable ICMP flood defense**

Click the checkbox to activate the ICMP flood defense function. Similar to the UDP flood defense function, the router will discard the ICMP echo requests coming from the Internet, once they exceed the user-defined threshold (by default, 300 packets per second) in a period of time (by default, 10 second for timeout).

### **Enable PortScan detection**

Port scan attacks occur by sending packets with different port numbers in an attempt to scanning the available services that one port will respond. To examine such exploration behavior, please click the checkbox to activate the Port Scan detection function in your Vigor router. The Vigor router will identify it and report a warning message if the port scanning rate in packets per second exceeds the user-defined threshold value. By default, the Vigor router sets the threshold as 300 packets per second to detect such a scanning activity.

### **Block IP options**

Click it to activate the Block IP options function. The Vigor router will ignore any IP packets with IP option field appeared in the datagram header. The IP option provides a way for hosts to send some significant information, such as security, compartmentation, TCC (closed user group) parameters, a series of Internet addresses, routing messages...etc., which an outsider can analyze to learn details about your private networks.

### **Block Land**

Click the associated checkbox and then enforce the Vigor router to defense the Land attacks. The LAN attack combines the SYN attack technology with IP spoofing. A Land attack occurs when an attacker sends spoofed SYN packets having the identical source and destination addresses, as well as the port number, with those of the victim.

### **Block Smurf**

Click the checkbox to activate the Block Smurf function. The Vigor router will reject any ICMP echo request destined to the broadcast address.

### **Block trace router**

Click the checkbox to activate this function. The Vigor router will not forward any trace route packets.

### **Block SYN fragment**

Click the checkbox to activate the Block SYN fragment function. Any packets having SYN flag and more fragment bit set will be dropped.

### **Block Fraggle Attack**

Click the checkbox to activate the Block fraggle Attack function. Any broadcast UDP packets received from the Internet is blocked.

Activating the DoS/DDoS defense functionality might block some legal packets. For example, when you activate the fraggle attack defense, all broadcast UDP packets coming from the Internet are blocked. Therefore, the RIP packets from the Internet might be dropped.

### **Block TCP flag scan**

Click the checkbox to activate the Block TCP flag scan function. Any TCP packet with anomaly flag setting is dropped. Those scanning activities include ***no flag scan***, ***FIN without ACK scan***, ***SYN***

***FINscan, Xmas scan and full Xmas scan.***

**Block Tear Drop**

Click the checkbox to activate the Block Tear Drop function. Many machines may crash when receiving ICMP datagrams (packets) that exceed the maximum length. To avoid this type of attack, the Vigor router is designed to be capable of discarding any fragmented ICMP packets with a length greater than 1024 octets.

**Block Ping of Death**

Click the checkbox to activate the Block Ping of Death function. This attack involves the perpetrator sending overlapping packets to the target hosts so that those target hosts will hang once they re-construct the packets. The Vigor routers will block any packets realizing this attacking activity.

**Block ICMP Fragment**

Click the checkbox to activate the Block ICMP fragment function. Any ICMP packets with more fragment bit set are dropped.

**Block Unknown Protocol**

Click the checkbox to activate the Block Unknown Protocol function. Individual IP packet has a protocol field in the datagram header to indicate the protocol type running over the upper layer. However, the protocol types greater than 100 are reserved and undefined at this time. Therefore, the router should have ability to detect and reject this kind of packets.

### Warning Messages

All the warning messages will be sent to Syslog client after you enable the Syslog function. The administrator can setup the Syslog client in the **Syslog Setup** by using Web Configurator. Thus, the administrator can look at the warning messages from DoS Defense functionality through the DrayTek Syslog daemon. The format for this kind of the warning messages is similar to those in **IP Filter/Firewall** except for the preamble keyword “DoS”, followed by a name to indicate what kind of attacks is detected.

#### SysLog Access Setup

<input checked="" type="checkbox"/> Enable	Server IP Address	192.168.1.10
	Destination Port	514

The screenshot shows the DrayTek Syslog web interface. At the top, there's a 'Controls' section with a dropdown menu set to '192.168.1.1' and a 'Vigor2100 series' label. Below this, the 'LAN Status' section displays 'TX Packets' as 5650 and 'RX Packets' as 4517. To the right, the 'WAN Status' section shows 'Gateway IP (Static)' as 172.16.2.5, 'TX Packets' as 1190, and 'RX Rate' as 1. Below the WAN status, there's another section for 'WAN IP (Static)' as 172.16.2.84, 'RX Packets' as 13115, and 'TX Rate' as 1. The main part of the interface is a log table with columns 'Time', 'Host', and 'Message'. The log shows several entries from 'Vigor' at 'Jan 1 03:46:27' to 'Jan 1 03:45:52', all indicating 'DoS' attacks. The messages include details like 'DoS fraggle Block 172.16.2.1,10752 -> 255.255.255.255,234 PR udp len 20 328'. At the bottom, there's an 'ADSL Status' section with fields for 'Mode', 'State', 'Up Speed', 'Down Speed', 'SNR Margin', and 'Loop Att', all showing '...'. The interface also has tabs for 'Fire Wall Log', 'VPN Log', 'User Access Log', 'Call Log', 'WAN Log', 'Network Information', and 'Net State'.

Time	Host	Message

### 6.2.4 URL Content Filter

The URL content filtering facility in Vigor routers inspects every URL string in the HTTP request initiated inside against the keyword list. If the entire or part of the URL string (for instance, <http://www.ssex.com> as shown) matches any activated keyword, the Vigor router will block its associated HTTP request and a Syslog message will be automatically sent to the Syslog client. Also the Vigor router will discard any request that tries to retrieve the malicious code. Similarly, a Syslog message will be sent to the Syslog client.

The URL content filtering facility prevents users from accessing inappropriate websites whose URL strings are identified as prohibition.

You must clear your browser cache first so that the URL content filtering facility operates properly on a web page that you visited before.

#### **Enable URL Access Control**

One checkbox appears giving the choice to activate the *URL Access Control* or not. To enable it, click on the empty box image and, subsequently, the hook image (✓) will appear.

## Firewall Setup

**URL Content Filter Setup**

☒ **Enable URL Access Control**

Blocking Keyword List

No	ACT	Keyword	No	ACT	Keyword
1	<input checked="" type="checkbox"/>	MSN	5	<input type="checkbox"/>	
2	<input type="checkbox"/>		6	<input type="checkbox"/>	
3	<input type="checkbox"/>		7	<input type="checkbox"/>	
4	<input type="checkbox"/>		8	<input type="checkbox"/>	

Note that multiple keywords are allowed to specify in the blank. For example: **hotmail yahoo msn**

☒ **Prevent web access from IP address**

**Block Keyword List:** The Vigor router provides 8 frames for users to define keywords and each frame supports multiple keywords. The keyword could be a noun, a partial noun, or a complete URL string. Multiple keywords within a frame are separated by space, comma, or semicolon. In addition, the maximal length of each frame is 32-character long. After specifying keywords, the Vigor router will reject the access right of any website whose whole or partial URL string matched any user-defined keyword. It should be noticed that the more simplified the blocking keyword list, the more efficiently the Vigor router perform.

If you want to filter any website whose URL string contains “sex”, “fuck”, “gun”, or “drug”, you should add these words into the frames. Thus, your Vigor router will automatically deny any web surfing that its associated URL string contains any one of the list’s keywords.

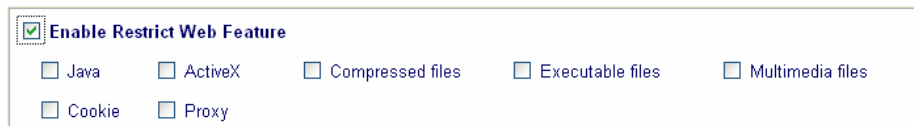

Considering that the user tries to access [www.backdoor.net/images/sex /p\\_386.html](http://www.backdoor.net/images/sex/p_386.html), the Vigor router will cut the connection because this website is prohibited.

Further, the URL content filtering facility also allows you to specify either a complete URL string (e.g., “www.whitehouse.com” and “www.hotmail.com”) or a partial URL string (e.g., “yahoo.com”) in the blocking keyword list.

**Prevent Web Access by IP Address:** One checkbox is available to activate this function that will deny any web surfing activity by directly using IP address. To enable it, click on the empty box image and, subsequently, the hook image (✓) will appear.

### **Enable Restrict Web Feature**

It will be of great value to provide the protection mechanism that prohibits the malicious codes from downloading from web pages. The malicious codes may embed in some executable objects, such as *ActiveX*, *Java Applet*, *compressed files*, and *executable files*, and, if they have been downloaded from websites, would bring a threat of the user's system. For example, an ActiveX object can be downloaded and run from the web page. If the ActiveX object has some malicious code in it, it may own unlimited access to the user's system.

<b>Java</b>	Click the checkbox to activate the Block Java object function. The Vigor router will discard the Java objects from the Internet.
<b>ActiveX</b>	Click the checkbox to activate the Block ActiveX object function. Any ActiveX object from the Internet will be refused.
<b>Compressed file</b>	One checkbox appears giving the choice to activate the Block Compressed file function to prevent someone from downloading any compressed file. The following list shows the types of compressed files that can be blocked by the Vigor router. <b>.zip, .rar,.arj,.ace,.cab,.sit</b>

## *Firewall Setup*

	To enable it, click on the empty box image and, subsequently, the hook image (✓) will appear.
<b>Executable file</b>	Similar to the above function, click the checkbox to enable the Block Executable file function to reject any downloading behavior of the executable file from the Internet. To enable it, click on the empty box image and, subsequently, the hook image (✓) will appear. Accordingly, the Vigor router will block files with the following extensions. <b>.exe,.com,.scr,.pif,.bas,.bat,inf,.reg</b>

A so-called *cookie* feature introduced by Netscape allows you to keep a close watch on the activities of HTTP request and responses of individual sessions. Many websites use them to create stateful sessions for tracking Internet users, which will violate the users' privacy. Thus, the Vigor router provides the *Cookies filtering facility* that allows you to filter cookie transmission from inside to outside world. Furthermore, the Vigor router also allows you to filter out all proxy-related transmission in order to support stronger security.

<b>Cookie</b>	Click the checkbox to activate the Block Cookie transmission. The Vigor router will filter out the cookie transmission from inside to outside world in order to protect the local user's privacy.
<b>Proxy</b>	<p>One checkbox appears giving the choice to activate this function to reject any proxy transmission. To enable it, click on the empty box image and, subsequently, the hook image (✓) will appear.</p> <p>To control efficiently the limited-bandwidth usage, it will be of great value to provide the blocking mechanism that filters out the multimedia files downloading from web pages. To enable it, click on the empty box image and, subsequently, the hook image (✓) will appear. Accordingly, files with the following extensions will be blocked by the Vigor router.</p> <p><b>.mov .mp3 .rm .ra .au .wmv</b> <b>.wav .asf .mpg .mpeg .avi .ram</b></p>

### Enable Excepting Subnets

4 entries are available for users to specify some specific IP addresses or subnets so that they can be free from the *URL Access Control*. To enable an entry, click on the empty checkbox, named as “**ACT**”, in front of the appropriate entry. The hook image (✓) appears to indicate the entry is active. To disable an entry, click on the hook image (✓).

No	Act	IP Address		Subnet Mask
1	<input checked="" type="checkbox"/>	192.168.1.10	~	255.255.255.0
2	<input type="checkbox"/>	□.□.□.□	~	□.□.□.□
3	<input type="checkbox"/>	□.□.□.□	~	□.□.□.□
4	<input type="checkbox"/>	□.□.□.□	~	□.□.□.□

### Time Schedule

Specify what time should perform the URL content filtering facility.

<b>Time Schedule</b>	
<input type="radio"/> Always Block	
<input checked="" type="radio"/> Block From 21 : 0 To 8 : 30	
Day of Week:	
<input type="radio"/> Everyday	
<input checked="" type="radio"/> Days	
<input type="checkbox"/> Sun	<input checked="" type="checkbox"/> Mon
<input checked="" type="checkbox"/> Tue	<input checked="" type="checkbox"/> Wed
<input checked="" type="checkbox"/> Thu	<input checked="" type="checkbox"/> Fri
<input type="checkbox"/> Sat	

<b><i>Always Block</i></b>	Click it so that the URL content filtering facility can be executed on the Vigor router anytime.
<b><i>Block from H1:M1 To H2:M2</i></b>	Specify the appropriate time duration from <i>H1:M1</i> to <i>H2:M2</i> in one day, where <i>H1</i> and <i>H2</i> indicate the hours. <i>M1</i> and <i>M2</i> represent the minutes.
<b><i>Days of Week</i></b>	Specify which days in one week should apply the URL content filtering facility. The Vigor router supports two exclusive options for users, i.e. everyday or some days in one week. If you expect that the URL content filtering facility is active for whole week, you should click the checkbox “ <b>Everyday</b> ”. Otherwise, you should point

## Firewall Setup

	clearly out the days in one week. For example, if you want the URL content filtering facility to work from Monday to Wednesday, then you should click the appropriate checkboxes (Monday, Tuesday, and Wednesday). Other days the URL content filtering facility will be silent.
--	--

If you want your kids not to be addicted to on-line gaming, you apply the URL content filtering facility to your router and you set time schedule for school days in order to let your kids have good sleep.

## Warning Messages

When a HTTP request is denied, an alert page will appear in your browser, as shown in the following figure.

Also, the warning message will be automatically sent to the Syslog client after you enable the Syslog function. The administrator can setup the Syslog client in the **Syslog Setup** by using Web Configurator. Thus, the administrator can view the warning messages from the **URL Content Filtering** functionality through the DrayTek Syslog daemon. The format for this kind of the warning messages is similar to those in the

## Firewall Setup

**IP Filter/Firewall** except for the preamble keyword “**CF**”, followed by a name to indicate what kind of the HTTP request is blocked.

### SysLog Access Setup

<input checked="" type="checkbox"/> Enable	
Server IP Address	192.168.1.10
Destination Port	514

The screenshot displays the DrayTek Syslog web interface. At the top, there are controls for enabling Syslog and a dropdown menu showing '192.168.1.1' and 'Vigor2100 series'. Below this, the LAN Status section shows TX Packets (1) and RX Packets (2). The WAN Status section shows Gateway IP (Static) as 172.16.2.5, TX Packets (0), and RX Rate (469). Below the WAN Status, there are fields for WAN IP (Static) as 172.16.2.84, RX Packets (16), and TX Rate (0). The main part of the interface is a log table with columns for Time, Host, and Message. The log entries show various blocked requests, including CF java Block and CF keyword Block. At the bottom, there is an ADSL Status section with fields for Mode, State, Up Speed, Down Speed, SNR Margin, and Loop Att.

Time	Host	Message

# Chapter 7

## Application Setup

---

### 7.1 Introduction

This section includes **Dynamic DNS**, **Call Schedule**, **RADIUS setup**, and **UPnP settings**.

Before you set up the **Dynamic DNS** (Domain Name Server) function, you have to subscribe free domain names from the Dynamic DNS service providers. The Vigor router provides up to three accounts for the function and supports the following providers: [www.dynsns.org](http://www.dynsns.org), [www.dynamic-nameserver.com](http://www.dynamic-nameserver.com), [www.no-ip.com](http://www.no-ip.com), [www.dtdns.com](http://www.dtdns.com), [www.changeip.com](http://www.changeip.com). You should visit their websites to register your own domain name for the router. The Dynamic DNS function allows the router to update its online WAN IP address that assigned by ISP to the specified Dynamic DNS server. Once the router is online, you will be able to use the registered domain name to access the router or internal virtual servers from the Internet.

**Call Schedule** facility is used to control the router's dialer or connection manager what time should be up or down according to the pre-defined call schedule profiles. Before configuring the Call Schedule function, you have to set up time function properly and arrange schedules for specified Internet access profile or LAN-to-LAN profile. The Vigor router has built a real time clock that can update itself from your browser manually or automatically from an Internet time server (NTP). As a result, you can schedule the router to dial to Internet at a pre-set time, but also to restrict Internet access to certain hours so that the router will

only let users of LAN to access Internet at certain times (e.g. business hours).

The **UPnP** (Universal Plug and Play) protocol is supported to bring to network connected devices the ease of installation and configuration which is already available for directly connected PC peripherals with the existing Windows 'Plug and Play' system. For NAT routers, the major feature of UPnP on the router is "NAT Traversal". This enables applications inside the firewall to automatically open the ports that they need to pass through a router. It is more reliable than requiring a router to work out by itself which ports need to be opened. Further, the user does not have to manually set up port mappings or a DMZ. UPnP is available on Windows XP and the router provides the associated support for MSN Messenger to allow full use of the voice, video and messaging features.

## 7.2 Settings

Click **Application Setup** to open the setup page.

<b>Dynamic DNS</b>	Settings of domain names you subscribe from up to three Dynamic DNS service providers.
<b>Call Schedule</b>	Settings of a real time clock that update automatically from an Internet time server (NTP).
<b>RADIUS Setup</b>	Settings of RADIUS server
<b>UPnP</b>	Settings of UPnP protocol available for directly connected PC peripherals with the existing Windows 'Plug and Play' system.

## 7.2.1 Dynamic DNS

### Enable the Function and Add a Dynamic DNS Account

1. Assume you have a registered domain name from the DDNS provider, say **hostname.dyndns.org**, and an account with username: **test** and password: **test**.
2. In the DDNS setup menu, Check **Enable Dynamic DNS Setup** and Index number **1** to add an account for the router. And now, you will see the following web page.

**Dynamic DNS Setup**

☒ Enable Dynamic DNS Setup View Log Force Update Clear All

Accounts

Index	Domain Name	Active
<u>1.</u>	---	x
<u>2.</u>	---	x
<u>3.</u>	---	x

**Index : 1**

☒ Enable Dynamic DNS Account

Service Provider : dyndns.org (www.dyndns.org) ▼

Service Type : Dynamic ▼

Domain Name : hostname . dyndns.org ▼

Login Name : test (max. 23 characters)

Password : .... (max. 23 characters)

☐ Wildcards

☐ Backup MX

Mail Extender :

**Note :** Before this account is worked, Dynamic DNS Service must be enabled in the following table!

OK Clear Cancel

3. Check **Enable Dynamic DNS Account**, and choose correct **Service Provider: dyndns.org**, type the registered hostname: **hostname** and domain name suffix: **dyndns.org** in the **Domain Name** block. The following two blocks should be typed your account **Login Name: test** and **Password: test**.
4. Push **OK** button to activate the settings.

The Wildcard and Backup MX features are not supported for all Dynamic DNS providers. You could get more detailed information from their websites.

### Disable the Function and Clear all Dynamic DNS Accounts

In the DDNS setup menu, uncheck **Enable Dynamic DNS Setup**, and push **Clear All** button to disable the function and clear all accounts from the router.

### Delete a Dynamic DNS Account

In the DDNS setup menu, Click the **Index** number you want to delete and then push **Clear All** button to delete the account.

## Validation and Troubleshooting

### Ping the Registered Domain Name

1. After router is online, use PING utility to probe your registered domain name in order to verify if it works.
2. Login **Online Status** in the main menu to make sure the responded IP address from the Dynamic DNS server should be the same as router's WAN IP address.

### View the DDNS Logs

1. Applications >> Dynamic DNS Setup.
2. Push **View Log** button. The logs of DDNS updates will be shown as follows.

#### DDNS Log

```
00:00:02.0 A= , H= , U= 1
00:00:02.0 Account is not enabled.
00:00:04.0 >>>> DDNS is updating. <<<<
00:00:04.0 A= , H= , U= 1
00:00:04.0 Account is not enabled.
00:00:04.0 A= , H= , U= 1
00:00:04.0 Account is not enabled.
00:00:04.0 A= , H= , U= 1
00:00:04.0 Account is not enabled.
```

Where A : Login Name

H : Domain Name without suffix.

Return Code= good 61.230.170.145

If you have any DDNS update issues, the logs are useful to find where the problem is.

3. Click **Online Status** to know what the current WAN IP address is.

#### WAN Status

Mode

PPPoE

IP Address

61.230.170.145

You will see the IP address in the circle, which is the same as the Return Code in the DDNS logs. This indicates that the update is successful.

## 7.2.2 Call Schedule

On the **Time Setup** menu, if you press **Inquire Time** button, the router's clock will be set to current time of your PC. The clock will reset if you power down or reset the router so you may prefer to use an NTP server on the Internet (a time server) to update the clock automatically. NTP updates only occur when the router is online to the Internet; they will not trigger calls themselves.

You can have up to 15 entries of different schedules and you must then apply the required schedule(s) to the appropriate ISP by entering the schedule number into the ISP setup:

## Application Setup

Call Schedule Setup:

[Clear All](#)

Index	Status	Index	Status

<u>1.</u>	x	<u>9.</u>	x

Click **Clear All** button to remove all schedules in the router.

Click **Cancel** button to give up the current editing-operation and then return back to the Main Setup menu.

## Add a Call Schedule

1. Click any index, say Index No. 1. The detailed settings of the call schedule with index 1 are shown as follows.

**Index No. 1**

☒ Enable Schedule Setup

Start Date (yyyy-mm-dd)    2004    12    21

Start Time (hh:mm)    0 : 0

Duration Time (hh:mm)    0 : 0

Action    Force On

Idle Timeout    0, 0 for default)

How Often

☐ Once

☒ Weekdays

☐ Sun    ☒ Mon    ☒ Tue    ☒ Wed    ☒ Thu    ☒ Fri    ☐ Sat

OK    Clear    Cancel

2. The detailed descriptions for each setting are:

**Enable Schedule Setup**: Check to enable the schedule.

**Start Date (yyyy-mm-dd)**: Specify the starting date of the schedule.

**Start Time (hh:mm)**: Specify the starting time of the schedule.

**Duration Time (hh:mm)**: Specify the duration (or period) for the schedule.

### **Action**:

Specify which action Call Schedule should apply during the time period of the schedule.

<b><i>Force On</i></b>	Force the connection to be always on.
<b><i>Force Down</i></b>	Force the connection to be always down.
<b><i>Enable Dial-On-Demand</i></b>	Specify the connection to be dial-on-demand and the value of idle timeout should be specified as following <b>Idle Timeout</b> field.

## Application Setup

	<div style="border: 1px solid #ccc; padding: 5px;"> <input checked="" type="checkbox"/> Enable Schedule Setup  <div style="display: flex; justify-content: space-between; margin-top: 5px;"> <span>Start Date (yyyy-mm-dd)</span> <span>2004 - 12 - 21</span> </div> <div style="display: flex; justify-content: space-between; margin-top: 5px;"> <span>Start Time (hh:mm)</span> <span>0 : 0</span> </div> <div style="display: flex; justify-content: space-between; margin-top: 5px;"> <span>Duration Time (hh:mm)</span> <span>0 : 0</span> </div> <div style="display: flex; justify-content: space-between; margin-top: 5px;"> <span>Action</span> <span>Force Down</span> </div> <div style="display: flex; justify-content: space-between; margin-top: 5px;"> <span>Idle Timeout</span> <span style="border: 2px solid #e00; padding: 2px;">0 minute(s). (max. 255, 0 for default)</span> </div> </div>
<b>Disable Dial-On-Demand</b>	Specify the connection to be up when it has traffic on the line. Once there is no traffic over idle timeout, the connection will be down and never up again during the schedule.

**Idle Timeout:** Specify the duration (or period) for the schedule.

<b>How often</b>	Specify how often the schedule will be applied
<b>Once</b>	The schedule will be applied just once
<b>Weekdays</b>	Specify which days in one week should perform the schedule.

3. Specify appropriate time duration and action to the profile and then click **OK** button to apply.
4. Specify the call schedule to specific Internet access profile or LAN-to-LAN profile.

## An Example

Suppose you want to control the PPPoE Internet access connection to be always on (Force On) from 9:00 to 18:00 for whole week. Other time the Internet access connection should be disconnected (Force Down).

1. Make sure the PPPoE connection and **Time Setup** is working properly.
2. Configure the PPPoE always on from 9:00 to 18:00 for whole week.

### Index No. 1

☒ Enable Schedule Setup

Start Date (yyyy-mm-dd) 2005 - 2 - 2

Start Time (hh:mm) 9 : 0

Duration Time (hh:mm) 9 : 0

Action Force On

Idle Timeout 0 minute(s).(max. 255, 0 for default)

How Often

☐ Once

☒ Weekdays

☒ Sun ☒ Mon ☒ Tue ☒ Wed ☒ Thu ☒ Fri

☒ Sat

3. Configure the Force Down from 18:00 to next day 9:00 for whole week.

### Index No. 2

☒ Enable Schedule Setup

Start Date (yyyy-mm-dd) 2005 - 2 - 2

Start Time (hh:mm) 18 : 0

Duration Time (hh:mm) 15 : 0

Action Force Down

Idle Timeout 0 minute(s).(max. 255, 0 for default)

How Often

☐ Once

☒ Weekdays

☒ Sun ☒ Mon ☒ Tue ☒ Wed ☒ Thu ☒ Fri

☒ Sat

## Application Setup

- Assign these two profiles to the PPPoE Internet access profile.  
Now, the PPPoE Internet connection will follow the schedule order to perform “Force On” or “Force Down” action according to the time plan that has been pre-defined in the schedule profiles.

**PPPoE Client Mode**

<b>PPPoE Setup</b> PPPoE Link <input checked="" type="radio"/> Enable <input type="radio"/> Disable <b>ISP Access Setup</b> ISP Name <input type="text" value="draytek"/> Username <input type="text" value="draytek"/> Password <input type="password" value="•••••"/> Scheduler (1-15) => <input type="text" value="1"/> , <input type="text" value="2"/> , <input type="text"/> , <input type="text"/>	<b>PPP/MP Setup</b> PPP Authentication <input type="text" value="PAP or CHAP"/> <input type="checkbox"/> Always On Idle Timeout <input type="text" value="180"/> second(s) <b>IP Address Assignment Method (IPCP)</b> Fixed IP <input type="radio"/> Yes <input checked="" type="radio"/> No (Dynamic IP) Fixed IP Address <input type="text"/> <b>WAN physical type</b> <input type="text" value="Auto negotiation"/>
--	--

### 7.2.3 UPnP

You can enter the **UPNP Setup** as below as below picture shown.

#### Applications >> UPnP Setup

**UPNP Setup**

☐ Enable UPnP Service

☐ Enable Connection control Service

☐ Enable Connection Status Service

**Note :** If you intend running UPnP service inside your LAN, you should check the appropriate service above to allow control, as well as the appropriate UPnP settings.

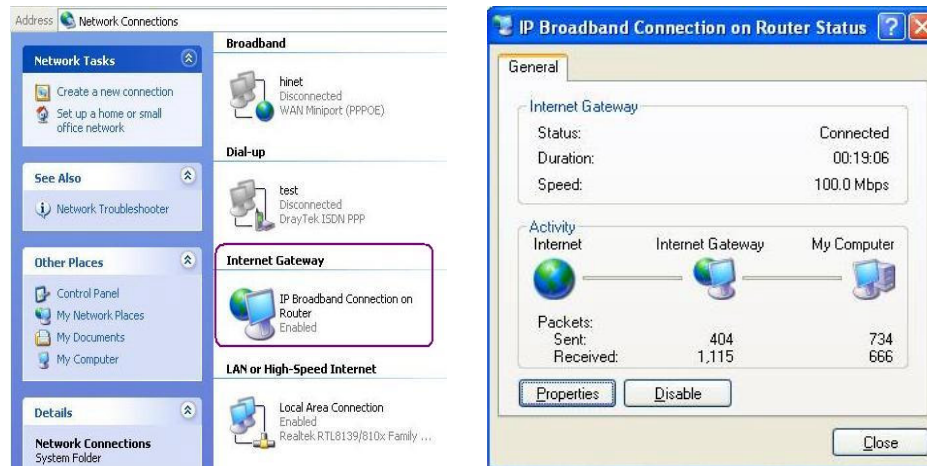

#### Enable UPNP Service:

Accordingly, you can enable either the **Connection Control Service** or **Connection Status Service**.

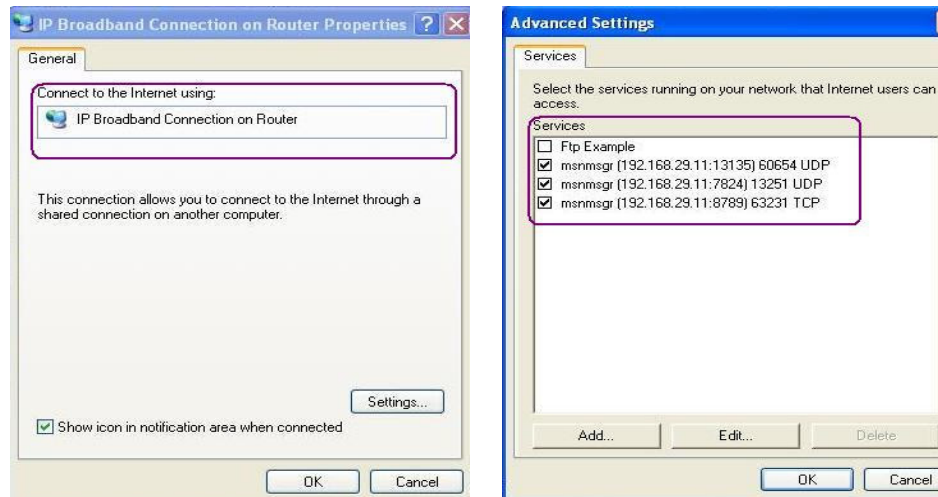

Click the **IP Broadband Connection on DrayTek Router** on Windows XP/Network Connections, as shown below. The connection status and control status will be able to be activated. The NAT Traversal of UPnP enables the multimedia features of your applications to operate. This has to manually set up port mappings or use other similar methods. The

## Application Setup

screenshots below show examples of this facility.

The UPnP facility on the router enables UPnP aware applications such as MSN Messenger to discover what are behind a NAT router. The application will also learn the external IP address and configure port mappings on the router. Subsequently, such a facility forwards packets from the external ports of the router to the internal ports used by the application.

**The reminder as regards concern about Firewall and UPnP**

### **Can't work with Firewall Software**

Enabling firewall applications on your PC may cause the UPnP function not working properly. This is because these applications will block the accessing ability of some network ports.

### **Security Considerations**

Activating the UPnP function on your network may incur some security threats. You should consider carefully these risks before activating the UPnP function.

1. Some Microsoft operating systems have found out the UPnP weaknesses and hence you need to ensure that you have applied the latest service packs and patches.
2. Non-privileged users can control some router functions, including removing and adding port mappings.

The UPnP function dynamically adds port mappings on behalf of some UPnP-aware applications. When the applications terminate abnormally, these mappings may not be removed.

## 7.2.4 Email detection

The router can help you detect whether any new email on the assigned mail account. Up to 5 mail accounts can be set.

### Index No. 1

<input checked="" type="checkbox"/> Enable

## Chapter 8

# VoIP Setup (for V models)

---

### 8.1 Introduction

Voice over IP network (VoIP) enables you to use your broadband Internet connection to make toll quality voice calls over the Internet.

There are many different call signaling protocols, methods by which VoIP devices can talk to each other. The most popular protocols are SIP, MGCP, Megaco and the older H.323. These protocols are not all compatible with each other (except via a soft-switch server).

The Vigor2100 V models support the SIP protocol as this is an ideal and convenient deployment for the ITSP (Internet Telephony Service Provider) and softphone and is widely supported. SIP is an end-to-end, signaling protocol that establishes user presence and mobility in VoIP structure. Every one who wants to talk using SIP protocol will need a “SIP Address”. The standard format of SIP Address is

**display name<username @ domain name of SIP Registrar >.**

It is very similar to a URL so some may call it “SIP URL”. SIP supports peer-to-peer direct calling and also calling via a SIP proxy server (a role similar to the gatekeeper in H.323 networks). The MGCP protocol uses a client-server architecture, the calling scenario being very similar to the current PSTN network.

After a call is setup, the voice streams transmit via RTP (Real-Time Transport Protocol). Different codecs (methods to compress and encode the voice) can be embedded into RTP packets. Vigor2100 V models provide various codecs, including G.711 A/μ-law, G.723, G.726

and G.729 A & B. Each codec uses a different bandwidth and hence provides different levels of voice quality. The more bandwidth a codec uses the better the voice quality, however the codec used must be appropriate for your Internet bandwidth.

Usually there will be two types of calling scenario, as illustrated below:

### 1. Calling via SIP Servers

First, the Vigor VoIP routers of yours will have to register to a SIP Registrar by sending registration messages. Then, SIP proxy will forward both of your calls to each other.

If you both register to the same SIP Registrar, then it will be illustrated as below:

The major benefit of this mode is that you don't have to memorize your friend's IP address, which might change very frequently if it's dynamic. Instead of that, you will only have to using **dial plan** or directly dial your friend's **account name** if you are with the same SIP Registrar. Please refer to the Example 1 and 2 in the 4.3 Calling Scenario.

### 2. Peer-to-Peer

Before calling, you have to know your friend's **IP Address**. The Vigor VoIP Routers will build connection between each other. Please refer to the Example 3 in the 4.3 Calling Scenario.

Our Vigor2100 V models firstly apply efficient codecs designed to make the best use of available bandwidth, but Vigor2100 V models also equip with **automatic QoS assurance**. QoS Assurance assists to assign high priority to voice traffic via Internet. You will always have the required inbound and outbound bandwidth that is prioritized exclusively for Voice traffic over Internet but you just get your data a little slower and it is tolerable for data traffic.

## 8.2 Settings

Click **VoIP Setup** to open the setup page.

<b>DialPlan</b>	Pre-settings of up to 60 SIP URL of VoIP contacts.
<b>SIP Related Function</b>	Settings of your SIP port, registrar, proxy, domain and Stun server.
<b>CODEC/RTP/DTMF</b>	Settings of default codec, DTMF and RTP

## VoIP Setup

<b>Voice Call Status</b>	Call Status including registered registrar, codec, connection and others.
<b>QoS</b>	Enter upstream speed wanted to assure for VoIP call

### 8.2.1 DialPlan

In this section, you can set your VoIP contacts in the “phonebook” we called DialPlan - help you to make calls quickly and easily by using “speed-dial” **Phone Number**. There are total 60 index entries in the DialPlan for you to store all your friends and family members’ SIP addresses.

#### Index No. 1

☒ Enable

Phone Number

:

Display Name

:

SIP URL

:

@

Loop through

:

▼

Backup Phone Number

:

OK

- Enable** Tick this to enable this entry.
- Phone Number** The “Speed-dial” number of this index. This can be any number you choose, using digits 0-9 and\*
- Display Name** The “Caller-ID” that you want to be displayed on your friend’s screen. This let your friend can easily know who’s calling without memorizing lots of SIP URL Address.
- SIP URL** Enter your friend’s SIP Address

### **Loop Through**

This function provides comprehensive ways to call your friend.

**PSTN:** When the router detect your Internet connection is available, the router will dial SIP URL so your call will be directed via Internet. If the Internet connection is down, Loop Through function enable the router automatically dial Backup Phone Number so your call will be directed via PSTN network. This ensures your call will always be dialed.

This is important because you don't want your call get trapped in the VoIP mechanism. Please be sure to fill in the Backup Phone Number.

**None:** The router will always dial SIP URL no matter what the status of Internet connection is. It might cause your call failed due to the Internet connection might not be available.

Although the Loop Through function provides convenient live lines for your call, you might prefer None for directing all calls via Internet. Please be reminded that you can still make the call via PSTN by manually dialing **#0** first.

This will also work if you may wish to know in which way every call dials out so that you can count how much they save before receiving the phone bill.

### **Backup Phone Number**

The telephone number to dial if you select **PSTN** in **Loop Through**

## 8.2.2 SIP Related Function

In this section, you set up your own SIP settings. When you apply for an account, your SIP service provider will give you an **Account Name** or user name, **SIP Registrar**, **Proxy**, and **Domain name**. (The last three might be the same in some case). Then you can tell your folks your SIP Address as in **Account Name@ Domain name**

As Vigor VoIP Router is turned on, it will first register with Registrar using AuthorizationUser@Domain/Realm. After that, your call will be bypassed by SIP Proxy to the destination using AccountName@Domain/Realm as identity.

## VoIP Setup

Please set each field in the **SIP** and **Ports Settings** accordingly. Click **OK** to apply settings.

### SIP

SIP Port	:	5060	
Registrar	:	draytel.org	
Proxy	:	draytel.org	<button>Duplicate</button>
Domain/Realm	:	draytel.org	<button>Duplicate</button>
<input checked="" type="checkbox"/> Stun Server	:		

### Ports Setting

<b>Port 1</b>			
<input checked="" type="checkbox"/> Use Registrar			
Display Name	:	Tina	
Account Name	:	899999	
Authorization User	:	899999	<button>Duplicate</button>
Password	:	••••••	
Expiry Time	:	2 hours	<input type="button" value="v"/>

The detail explanation of the SIP and Port settings window:

### **SIP Port**

Set the port number for sending/receiving SIP message for building a session. The default value is **5060**. Your peer must set the same value in his/her Registrar.

### **Registrar**

Set the domain name or IP address of the SIP Registrar server.

### **Proxy**

Set domain name or IP address of SIP proxy server. If this setting value is the same as Registrar, please press "Duplicate".

## VoIP Setup

<b>Domain/Realm</b>	Set the domain name or IP address field of SIP Address, e.g., every text after @. If this setting value is the same as Registrar, please press "Duplicate".
<b>Use Registrar</b>	With the Registrar domain entered above, tick this box to let the Vigor2100 V models use the SIP Registrar.
<b>Display Name</b>	The "caller-ID" that you want to be displayed on your friend's screen.
<b>Account Name</b>	Enter your account name of SIP Address, e.g. every text before @.
<b>Authorization User</b>	Enter the name or number used for SIP Authorization with SIP Registrar. If this setting value is the same as Account Name, please press "Duplicate".
<b>Password</b>	The password provided to you when you registered with a SIP service.
<b>Expire Time</b>	The time duration that your SIP Registrar server keeps your registration record. Before the time expires the Vigor2100 V models will send another register request to SIP Registrar again.

In the "**VoIP Call Status**" you will find an "R" indicating you have registered with your SIP server.

### VoIP Call Status

Channel Volume: << >>

Refresh Seconds : 10 Refresh View Log

Channel	Status	Codec	PeerID	Connect Time	Tx Pkts	Rx Pkts	Rx Losses	Rx Jitter (ms)	In Calls	Out Calls	Volume Gain

Packet Size	:	20ms ▼

#### DTMF

<input checked="" type="radio"/> InBand	<input type="radio"/> OutBand	Payload Type:	101	<input type="radio"/> SIP INFO
---	-------------------------------	---------------	-----	--------------------------------

#### RTP

Dynamic RTP port start	:	10050
Dynamic RTP port end	:	15000

### Default Codec

Select one of five codecs as the default for your VoIP calls. The codec used for each call will be negotiate with the peer party before each session, and so many not be your default choice. The default codec is G.729A/B; it occupies little bandwidth while maintaining good voice quality.

If your upstream speed is only 64Kbps, do not use G.711 codec. It is better for you to have at least 256Kbps upstream if you would like to use G.711

### Packet Size

The amount of data contained in a single packet. The default value is 20 ms, which means the data packet will contain 20 ms voice information.

### DTMF InBand

With this selected the Vigor will send DTMF tones as audio directly in the Voice stream when you press a key on the keypad.

### **DTMF OutBand**

With OutBand selected the Vigor will capture the keypad number pressed, transform it to a digital form and send to the other side outside of the Voice stream; the receiver will generate the tone according to the digital form it receives. This function is very useful when network traffic congestion occurs to maintain the accuracy of DTMF tones.

### **DTMF Payload Type**

The default value is 101, but can be anything from 96 to 127.

### **SIP Info**

Enable this option to let the SIP proxy send DTMF tones to the dialed peer.

### **RTP**

Specifies the start and end port for RTP stream. The default values are 10050 and 15000.

## 8.3 Calling Scenario

### Calling via SIP Sever

#### **Example 1**

John and David both have a SIP Address from **different** service providers.

John's SIP URL: **1234@draytel.org**

David's SIP URL: **4321@iptel.org**

**1**

#### **John's settings**

##### **DialPlan index 1**

Phone Number: **1111**  
Display Name: **David**  
SIP URL: **4321@iptel.org**

##### **SIP Related Function**

SIP Port: 5060 (default)  
Registrar: **draytel.org**  
Proxy: (Duplicate)  
Domain/Realm: (Duplicate)  
**Port 1:**  
Use Registrar: (checked)  
Display Name: john  
Account Name: **1234**  
Authorization User: (Duplicate)  
Password: \*\*\*\*\*  
Expiry Time: (use default value)

**CODEC/RTP/DTMF**  
(Use default value)

#### **David's settings**

##### **DialPlan index 1**

Phone Number: **2222**  
Display Name: **John**  
SIP URL: **1234@draytel.org**

##### **SIP Related Function**

**(Use default value)**

**2**

#### **John calls David**

He picks up the phone and dials **1111#**. (DialPlan Phone Number for David)

#### **David calls John**

He picks up the phone and dials **2222#** (DialPlan Phone Number for John)

### 8.3.1 Voice Call Status

On VoIP call status, you can find the registered registrar, codec, connection and other important call status. Because Vigor2100 V models have one VoIP port for regular analogue phone set, there is one VoIP channel only.

**VoIP Call Status**

Channel Volume: << >> Refresh Seconds : 10 Refresh View Log

Channel	Status	Codec	PeerID	Connect Time	Tx Pkts	Rx Pkts	Rx Losses	Rx Jitter (ms)	In Calls	Out Calls	Volume Gain
1(R)	ACTIVE	G.711A	899999@draytel.org	122	12160	12206	6	8	0	5	5

(R) : Means you have registered your SIP server

#### Channel Volume

To adjust the volume of your VoIP calls, use these two buttons << >> to obtain appropriate **Volume Gain**.

#### Refresh Seconds

Specify the interval of refresh time to obtain the latest VoIP calling information. The information will update immediately when the **Refresh** button is clicked.

#### Status

Show the VoIP connection status.

<b>IDLE</b>	Indicates that the VoIP function is idle.
<b>HANG_UP</b>	Indicates that the connection is not established (busy tone).
<b>CONNECTING</b>	Indicates that the user is calling out.
<b>WAIT_ANS</b>	Indicates that a connection is launched and waiting for remote user's answer.
<b>ALERTING</b>	Indicates that a call is coming.
<b>ACTIVE</b>	Indicates that the VoIP connection is launched.

#### CODEC

The voice codec employed by present channel.

**PeerID**

The present in-call or out-call peer ID (the format may be IP or Domain).

**Connect Time**

The format is represented as seconds.

**Tx Pkts**

Total number of transmitted voice packets during this connection session.

**Rx Pkts**

Total number of received voice packets during this connection session.

**Rx Loss**

Total number of lost packets during this connection session.

**Rx Jitter**

The jitter of received voice packets.

**In Calls**

The accumulating in-call times.

**Out Calls**

The accumulating out-call times.

**Volume Gain**

The volume of present call.

**View Log**

To show the logs of VoIP calls as below.

## VoIP Setup

Also on System Status, you can find the registered registrar and codec for Inbound calls and Outbound calls. The said status easily let you check whether your registration of SIP server is successful or not.

### System Status

**Model Name** : Vigor2100 series  
**Firmware Version** : v2.5.5.2  
**Build Date/Time** : Tue Feb 15 17:46:58.13 2005

LAN		WAN	
MAC Address	: 00-50-7F-27-E5-41	MAC Address	: 00-50-7F-27-E5-42
IP Address	: 192.168.1.1	Connection	: Static IP
Subnet Mask	: 255.255.255.0	IP Address	: 172.16.2.24
DHCP Server	: Yes	Default Gateway	: 172.16.2.5
		DNS	: 194.109.6.66

VoIP		Wireless LAN	
Channel	: 1	MAC Address	: 00-11-09-0e-03-c7
SIP registrar	: draytel.org	Frequency	: Europe
Account ID	: 899999	Domain	
Register	: Yes	Firmware Version	: v1.2.8.16.04.2
Codec	: G.711A		
In Calls	: 0		
Out Calls	: 5		

## 8.3.2 QoS

Enter upstream speed to let Vigor2100 V models assure high priority for VoIP call.

### VoIP >> QoS

#### QoS Control

☒ Enable the QoS Control

Upstream Speed  Kbps

**Note** : QoS Priority for VoIP traffic.  
Set this to your Internet feed's upstream rate, e.g. 256Kb/s  
(Upstream' is the speed at which you transmit to the Internet)

## **Chapter 9**

# **Wireless LAN Setup(for G models)**

---

### **9.1 Introduction**

Over recent years, the market for wireless communications has enjoyed tremendous growth. Wireless technology now reaches or is capable of reaching virtually every location on the face of the earth. Hundreds of millions of people exchange information every day using wireless communication products. Therefore, the Vigor2100 G models are designed for increasing flexibility and efficiency of a small office/a home by deploying the WLAN network.

To elaborate one example, any authorized staff can bring a built-in WLAN client PDA or notebook into a meeting room for conference without laying a clot of LAN cable. One more example, parents can write E-mail at their study room and kids are also able to surf Internet at their bedrooms as the Vigor2100 G models are set up in some corner of a home. Parents do not need to drill any hole for installing LAN cable everywhere in the house. The Vigor2100 G models are equipped with a wireless LAN interface compliant with the IEEE 802.11g protocol supporting data rate of 54Mbps. The wireless LAN capability enables high mobility of several users so that they can simultaneously access all LAN facilities just like on a wired LAN as well as Internet and WAN access.

In this chapter, we explain the capabilities of the wireless LAN and its associated web configurations. Use the following setup path on the Setup Main Menu to configure the wireless LAN function.

## 9.2 Settings

After clicking the “**System maintenance→System status**”, you will see the following information:

**Wireless LAN**  
MAC Address : 00-0a-e9-01-4b-d0  
Frequency Domain :  
Firmware Version : v1.2.8.16.04.2

This web page will show the wireless LAN information including *MAC address* and *Frequency domain* and *Firmware Version*. For example, in this figure, the *Frequency Domain* can be Europe (13 usable channels), or the USA (11 usable channels) and the *MAC address* is set as 00-0a-e9-01-4b-do. The Firmware Version is the WLAN miniPCi.

The available channels supported by the wireless products in different countries are various.

### 9.2.1 General Settings

By clicking the **General Settings**, a new web page will appear so that you could configure the *SSID* and the *wireless channel*. Please refer to the following figure for more information.

## Wireless LAN Setup

### Wireless LAN >> General Settings

#### General Setting ( IEEE 802.11 )

<input checked="" type="checkbox"/>	Enable Wireless LAN
Mode :	Mixed(11b+11g) ▼
Scheduler (1-15)	<input type="text"/> , <input type="text"/> , <input type="text"/> , <input type="text"/>
SSID :	default
Channel :	Channel 6, 2437MHz ▼
<input type="checkbox"/>	Hide SSID
<input type="checkbox"/>	Long Preamble

**SSID** : wireless LAN Service Set ID.  
**Hide SSID** : the scanning tool can't read the SSID when sniffing radio.  
**Channel** : select the frequency channel of wireless LAN.  
**Long Preamble** : enable this only when meeting connectivity problems for some old 802.11b devices; otherwise, it reduces the performance.

### Enable Wireless LAN

Check the box to enable wireless function.

### Mode

Select an appropriate wireless mode.

- **Mixed (11b+11g)**: The radio can support both IEEE802.11b and IEEE802.11g protocols simultaneously.
- **11g-only**: The radio only supports IEEE802.11g protocol.
- **11b-only**: The radio only supports IEEE802.11b protocol.

### Scheduler

Set the wireless LAN to work at some time interval only. You may choose up to 4 schedules from the 15 schedules which are defined under Advanced Setup > Call Schedule Setup. Please refer to the detailed manual on the attached CD. The default setting is always working.

### SSID and Channel

The default SSID is "default". We suggest you change it to a particular name. In this case, SSID was changed to "DrayTek".

- **SSID (Service Set Identifier)**: It is used to name the wireless LAN, and must have the same content in client PC/notebook wireless

card(s). SSID can be any text numbers or various special characters.

- **Channel:** A wireless channel for the router. The default channel is 6. You can change it to more appropriate one if the selected channel is under serious interference.

### **Hide SSID**

Check it to prevent from wireless sniffing and make it harder for unauthorized clients to join your wireless LAN.

## **9.2.2 Security**

To improve the security and privacy of your wireless data packets, the WEP and WPA encryption feature can be deployed, where WEP stands for Wireless Equivalent Privacy. The WEP facility that uses a set of four *default keys* encrypts each frame transmitted from the radio using only one of the given keys. Default keys are shared between the Vigor wireless router and WEP station in a service set. Once a station has obtained the default keys for its service set, it may communicate using WEP. WPA (Wi-Fi Protected Access) uses the Temporal Key Integrity Protocol (TKIP) for encryption. It greatly enhances the over-the-air data protection and access control on existing Wi-Fi networks. It addresses the weaknesses of WEP. By clicking the **Security Settings**, a new web page will appear so that you could configure the settings of WEP and WPA.

## Wireless LAN Setup

### Security Settings

Mode:	Disable
<b>WPA:</b>	
Encryption Mode:	TKIP
Pre-Shared Key(PSK)	*****
Type 8~63 ASCII character or 64 Hexadecimal digits leading by "0x", for example "cfigs01a2..." or "0x655abcd....".	
<hr/>	
<b>WEP:</b>	
Encryption Mode:	64-Bit
<input checked="" type="radio"/> Key 1 :	*****
<input type="radio"/> Key 2 :	*****
<input type="radio"/> Key 3 :	*****
<input type="radio"/> Key 4 :	*****
<b>For 64 bit WEP key</b>	
Type 5 ASCII character or 10 Hexadecimal digits leading by "0x", for example "AB312" or "0x4142333132".	
<b>For 128 bit WEP key</b>	
Type 13 ASCII character or 26 Hexadecimal digits leading by "0x", for example "0123456789abc" or "0x30313233343536373839414243".	

### Mode

Select an appropriate encryption to improve the security and privacy of your wireless data packets.

- **Disable:** Turn off the encryption mechanism.
- **WEP Only:** Accepts only WEP clients and the encryption key should be entered in WEP Key.
- **WEP or WPA/PSK:** Accepts WEP and WPA clients simultaneously and the encryption key should be entered in WEP Key and PSK respectively.
- **WPA/PSK Only:** Accepts only WPA clients and the encryption key should be entered in PSK.

### WPA Encryption

The WPA encrypts each frame transmitted from the radio using the pre-shared key (PSK), which entered from this panel.

**-Pre-Shared Key (PSK):** Either 8~63 ASCII characters or 64 Hexadecimal digits leading by 0x can be entered. For example "0123456789ABCD...." or "0x321253abcde...".

### WEP Encryption

- **64-Bit:** For 64bits WEP key, either 5 ASCII characters or 10 hexadecimal digitals leading by **0x** can be entered. For example, **ABCDE** or **0x4142434445**.
- **128-Bit:** For 128bits WEP key, either 13 ASCII characters or 26 hexadecimal digits leading by **0x** can be entered. For example, **ABCDEFGHIJKLM** or **0x4142434445464748494A4B4C4D**.

128 bits WEP is most secure, but has more encryption/decryption overhead. Note that all wireless devices must support the same WEP encryption bit size and have the same key. Four keys can be entered here, but only one key can be selected at a time. The keys can be entered in ASCII or Hexadecimal. Click the circle under Use next to the key you wish to use.

### 9.2.3 Access Control

For additional security of wireless access, the **Access Control** facility allows you to restrict the network access right by controlling the wireless LAN MAC address of client. Only the valid MAC address that has been configured can access the wireless LAN interface. By clicking the **Access Control**, a new web page will appear, as depicted below, so that you could edit the clients' MAC addresses to control their access rights.

**Access Control**

☒ Enable Access Control

Index	MAC Address
1	00 : 34 : 22 : 21 : 12 : 33

MAC Address

:  :  :  :  :

**Note :** Add or remove the wireless user's MAC address to accept or deny the access to the network.

### Enable Access Control

Select to enable the MAC Address access control feature.

## MAC Address

Display all MAC addresses that are edited before. Four buttons (Add, Remove, Edit, and Cancel) are provided to edit a MAC address.

- ADD:** Add a new MAC address into the list.
- Remove:** Delete the selected MAC address in the list.
- Edit:** Edit the selected MAC address in the list.
- Cancel:** Give up the access control set up.
- Clean All:** Clean all entries in the MAC address list.
- OK:** Click it to save the access control list.

### 9.2.4 Station List

The Vigor router offers you a convenient **Station List facility** to scan the running WLAN clients being near the router. If neighbors or other WLAN clients are active, you can press "Refresh" to get available WLAN stations' information including its status and MAC address. You can select the wish WLAN station from **Station List** to add it to **Access Control** list by clicking highlight, and then press "Add". Or editing a station's MAC address manually is another option. After the these operations, you go to **Access Control** and the listed WLAN stations which are allowed to access network resources via the Vigor router.

**Station List**

Status	MAC Address
C	00 : 50 : 7F : 29 : 04 : 71

**Status Codes :**  
C : Connected.  
B : Blocked by Access Control.  
N : Establishing a new connection.  
F : Fail to pass 802.1X or WPA authentication.  
X : Doing 802.1X authentication.  
W : Doing WPA authentication.

**Note :** After a station connects to the router successfully, it may be turned off without notice. In that case, it will still be on the list until the connection expires.

---

Add to **Access Control** :

Client's MAC Address  :  :  :  :  :

# Chapter 10

## System Maintenance Setup

---

### 10.1 Introduction

The **System Status** provides basic network settings of Vigor router. It includes LAN and WAN interface information. Also, you could get the current running firmware version or firmware related information from this presentation.

The **Configuration Backup** enables you to keep running configurations of your current router as a file or restore the configurations with the file. The router provides a web-based way to let you backup or restore the configuration very simple.

By default, the router may be configured and managed through any Telnet client or Web browser running on any operating system. There is no requirement for additional software or utilities. However, for some specific environments, in **Management**, you may change the server port numbers for the built-in Telnet or HTTP server, create access control lists to protect the router, or reject the system administrator to login from the Internet.

Also in **Reboot System** and **Firmware Upgrade**, you can reboot the system once you finish some set up and upgrade firmware via TFTP.

## 10.2 Settings

Click **System Maintenance Setup** to open the setup page.

<b>System Status</b>	Pre-settings of up to 60 SIP addresses of VoIP contacts.
<b>Administrator Password</b>	Settings of SIP port, registrar, proxy, domain and Stun server.
<b>Configuration Backup</b>	Settings of default Codec, DTMF and RTP
<b>SysLog/Mail Alert</b>	Call Status including registered registrar, codec, connection and others.
<b>Time Setup</b>	Settings for time, either inquiring from PC or from NTP server.
<b>Management Setup</b>	Settings of Management Access Control, SNMP, and Port.
<b>Reboot System</b>	Manually reboot the system
<b>Firmware upgrade (TFTP)</b>	Upgrade the firmware via TFTP

## 10.2.1 System Status

In **System Status**, you will see the result shown on the right frame.

### System Status

Model Name : Vigor2100 series  
Firmware Version : v2.5.5.2  
Build Date/Time : Tue Feb 15 17:46:58.13 2005

LAN		WAN	
MAC Address	: 00-50-7F-27-E5-41	MAC Address	: 00-50-7F-27-E5-42
IP Address	: 192.168.1.1	Connection	: Static IP
Subnet Mask	: 255.255.255.0	IP Address	: 172.16.2.24
DHCP Server	: Yes	Default Gateway	: 172.16.2.5
		DNS	: 194.109.6.66

VoIP		Wireless LAN	
Channel	: 1	MAC Address	: 00-11-09-0e-03-c7
SIP registrar	: draytel.org	Frequency	: Europe
Account ID	: 899999	Domain	
Register	: Yes	Firmware Version	: v1.2.8.16.04.2
Codec	: G.711A		
In Calls	: 0		
Out Calls	: 5		

In order to let you know the settings result, we design the Status bar on Set-up Menu. You can find the “**Ready**” indicates that you can enter settings. “Settings Saved” means your settings are saved once you click “**Finish**” or “**OK**” button. If the settings are wrong or get problematic, you can find fail message on **Status** bar.

## 10.2.2 Administrator Password

### Administrator Password

Old Password	:	<input type="password"/>
New Password	:	<input type="password"/>
Retype New Password	:	<input type="password"/>

Here you can reset administrator password.

## 10.2.3 Configuration Backup

### Backup the Running Configuration

1. Go to **System Maintenance > Configuration Backup**. The following windows will be popped-up, as shown below.

## System Maintenance Setup

**Configuration Backup / Restoration**

**Restoration**

Select a configuration file.

Click Restore to upload the file.

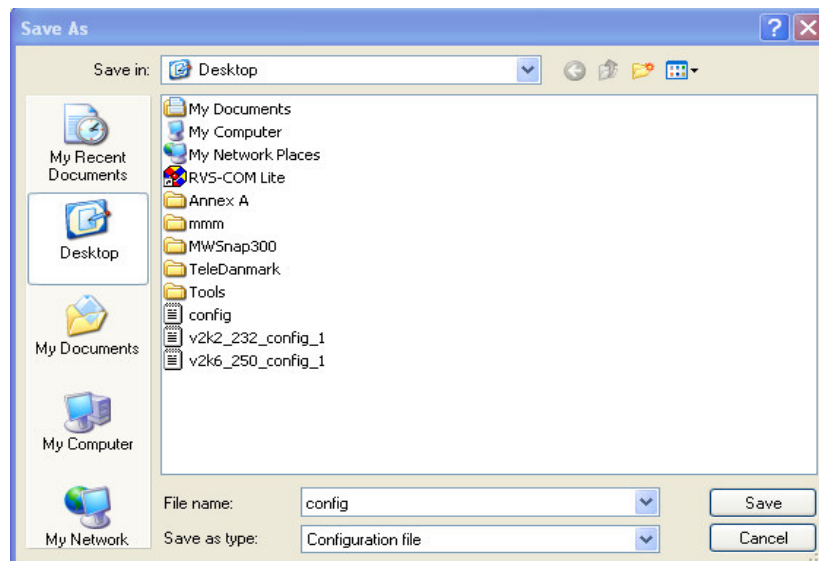

**Backup**

Click Backup to download current running configurations as a file.

2. Click Backup button to get configurations.

3. Click OK button to save configuration as a file. The default filename is **config.cfg**. You could give it another name by yourself.

4. Click **Save** button, the configuration will download automatically to your computer as a file named **config.cfg**.

The above example is using **Windows** platform for demonstrating examples. The **Mac** or **Linux** platform will appear different windows, but the backup function is still available.

### Restore the Configuration with a Configuration File

1. Go to **System Maintenance > Configuration Backup**. The following windows will be popped-up, as shown below.
2. Click **Browse** button to choose the correct configuration file for uploading to the router.

Configuration Backup / Restoration

**Restoration**

Select a configuration file.

Click Restore to upload the file.

**Backup**

Click Backup to download current running configurations as a file.

3. Click **Restore** button and wait for few seconds, the following picture will tell you that the restoration procedure is successful.

### 10.2.4 SysLog

SysLog function is provided to help users to monitor router. There is no bother to directly get into the Web Configurator of the router or borrow debug equipments.

1. Just set your monitor PC's IP address in this field.

SysLog Access Setup

☒ Enable

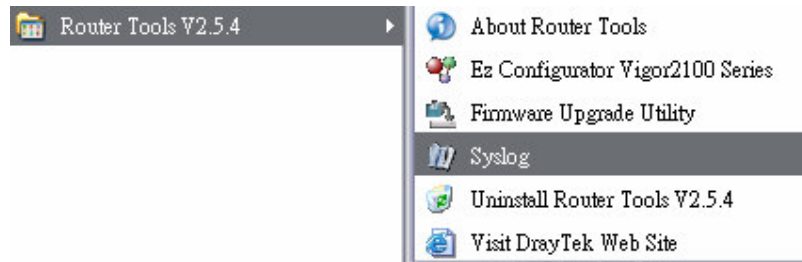

Server IP Address

Destination Port

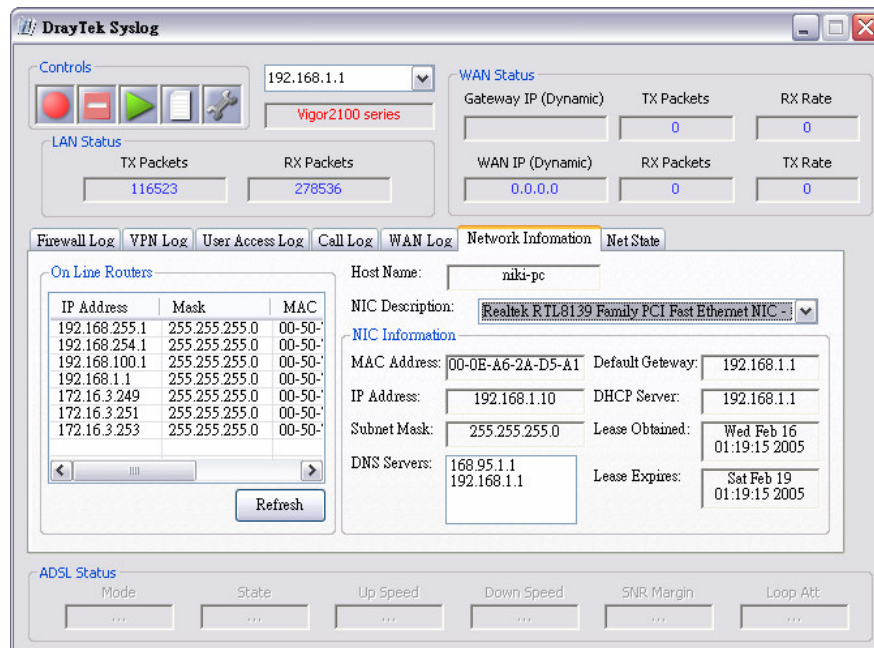

2. Install the Router Tools in the **Utility** within provided CD. In program menu, click on the **Router Tools>>Syslog**.

## System Maintenance Setup

3. Select the router you want to monitor. Then you will see the Syslog window. Be reminded that in **Network Information**, select the network adapter used to connect to the router. Otherwise, you won't succeed in retrieving information from the router.

## 10.2.5 Time Setup

To specify where should the time of the router to be inquired from.

**Time Information**

Current System Time	2000 Jan 1 Sat 22 : 5 : 24	<a href="#">Inquire Time</a>
---------------------	----------------------------	------------------------------

**Time Setup**

<input type="radio"/> Use Browser Time <input checked="" type="radio"/> Use Internet Time Client	
Time Protocol	NTP (RFC-1305) ▼
Server IP Address	pool.ntp.org
Time Zone	(GMT+08:00) Taipei ▼
Automatically Update Interval	30 sec ▼

### Time Information

Click on Inquire Time to get the current time.

### Time Setup

<b><i>Use Browser Time</i></b>	Select to collect time information from PC.
<b><i>Use Internet Time Client</i></b>	Select to inquire time information from Time Server on the Internet using assigned protocol.

## 10.2.6 Management

Click **Management Setup**. The following setup page will appear on your computer screen.

**Management Setup**

<p><b>Management Access Control</b></p> <p><input type="checkbox"/> Enable remote firmware upgrade(FTP)</p> <p><input type="checkbox"/> Allow management from the Internet</p> <p><input checked="" type="checkbox"/> Disable PING from the Internet</p> <p><b>Access List</b></p> <table style="width: 100%;"> <tr> <th>List</th> <th>IP</th> <th>Subnet Mask</th> </tr> <tr> <td>1</td> <td><input type="text"/></td> <td><input type="text"/> ▼</td> </tr> <tr> <td>2</td> <td><input type="text"/></td> <td><input type="text"/> ▼</td> </tr> <tr> <td>3</td> <td><input type="text"/></td> <td><input type="text"/> ▼</td> </tr> </table>	List	IP	Subnet Mask	1	<input type="text"/>	<input type="text"/> ▼	2	<input type="text"/>	<input type="text"/> ▼	3	<input type="text"/>	<input type="text"/> ▼	<p><b>Management Port Setup</b></p> <p><input type="radio"/> Default Ports (Telnet:23, HTTP:80, FTP:21)</p> <p><input checked="" type="radio"/> User Define Ports</p> <p>Telnet Port : <input type="text" value="23"/></p> <p>HTTP Port : <input type="text" value="80"/></p> <p>FTP Port : <input type="text" value="21"/></p>
List	IP	Subnet Mask

2	<input type="text"/>	<input type="text"/> ▼											
3	<input type="text"/>	<input type="text"/> ▼											

### **Management Setup**

The port number used to send/receive SIP message for building a session. The default value is 5060 and this must match with the peer Registrar when making VoIP calls.

<b><i>Enable remote firmware update</i></b>	Click the checkbox to allow remote firmware upgrade through FTP (File Transfer Protocol).
<b><i>Allow management from the Internet</i></b>	Enable the checkbox to allow system administrators to login from the Internet. By default, it is not allowed.
<b><i>Disable PING from the Internet</i></b>	Check the checkbox to reject all PING packets from the Internet. For security issue, this function is enabled by default.

### **Access List**

You could specify that the system administrator can only login from a specific host or network defined in the list. A maximum of three IPs/subnet masks is allowed.

<b><i>IP</i></b>	Indicate an IP address allowed to login to the router
<b><i>Subnet Mask</i></b>	Represent a subnet mask allowed to login to the router.

### **Management Port Setup**

<b><i>Default Ports</i></b>	Check to use standard port numbers for the Telnet and HTTP servers.
<b><i>User Defined Ports</i></b>	Check to specify user-defined port numbers for the Telnet and HTTP servers.

## 10.2.7 Reboot System

The Web Configurator may be used to restart your router. Click **Reboot System** in the main menu to open the following page.

### Reboot System

Do You want to reboot your router ?

- ☒ Using current configuration
- ☐ Using factory default configuration

If you want to reboot the router using the current configuration, check **Using current configuration** and click **OK**. To reset the router settings to default values, check **Using factory default configuration** and click **OK**. The router will take 5 seconds to reboot the system.

## 10.2.8 Firmware Upgrade (TFTP)

Before upgrading your router firmware, you need to install the Router Tools. The Firmware Upgrade Utility is included in the tools. The following steps will guide you to upgrade firmware. In the following, we use an example to explain the firmware upgrade. Note that this example is running over Windows OS (Operating System).

1. Download the newest firmware from DrayTek's web site or FTP site. The DrayTek web site is [www.draytek.com](http://www.draytek.com) (or local DrayTek's web site) and FTP site is [ftp.draytek.com](ftp://ftp.draytek.com)
2. Click System Maintenance>> Router Firmware Upgrade Utility to launch the Firmware Upgrade Utility.

## System Maintenance Setup

---

### Firmware Upgrade

Current Firmware Version : v2.5.5.2

#### Firmware Upgrade Procedures:

- 1: Click "OK" to start the TFTP server.
- 2: Open the Firmware Upgrade Utility or other 3-party TFTP client software.
- 3: Check that the firmware filename is correct.
- 4: Click "Upgrade" on the Firmware Upgrade Utility to start the upgrade.
- 5: After the upgrade is complete, the TFTP server will automatically stop running.

Do you want to upgrade firmware ?

Click the **Browse** button to locate the new firmware file. The program will look for any Vigor routers on your LAN and display them by IP address. Select the 'IP address' of the appropriate router to upgrade, then press **Upgrade**. Enter the router's password when asked (or press **OK** if there is no password). The upgrade action will start and the status will be shown on the progress bar. Once the upgrade operation has completed, wait approximately 30 seconds and the router will be ready (ACT light in the front panel of your router will resume flashing normally).

# Chapter 11

## Diagnostics Setup

### 11.1 Introduction

Diagnostic Tools provide a useful way to view or diagnose the status of your Vigor router.

### 11.2 Settings

Click **Diagnostics** to open the setup page.

#### 11.2.1 PPPoE/PPTP Diagnostics

PPPoE/PPTP Diagnostics		<a href="#">Refresh</a>
WBroadband Access Mode/Status	---	
Internet Access	<a href="#">Dial PPPoE or PPTP</a>	
WAN IP Address	---	
Drop Connection	<a href="#">Drop PPPoE or PPTP</a>	

<b>Refresh</b>	To obtain the latest information, click here to reload the page.
<b>Broadband Access Mode/Status</b>	Display the broadband access mode and status. If the broadband connection is active, it will show <b>PPPoE</b> , <b>PPTP</b> , <b>Static IP</b> , or <b>DHCP Client</b> depending on which access mode is enabled. If the connection is idle, it will show "---".
<b>WAN IP Address</b>	The WAN IP address for the active connection.
<b>Dial PPPoE or PPTP</b>	Click it to force the router to establish a PPPoE or PPTP connection.
<b>Dial PPPoE or PPTP</b>	Click it to force the router to establish a PPPoE or PPTP connection.

## 11.2.2 ARP Cache Table

Click **View ARP Cache Table** to view the content of the ARP (Address Resolution Protocol) cache held in the router. The table shows a mapping between an Ethernet hardware address (MAC Address) and an IP address.

**Ethernet ARP Cache Table** [Refresh](#)

IP Address	MAC Address
192.168.1.10	00-0E-A6-2A-D5-A1
192.168.1.11	00-50-7F-29-04-71

**Refresh:** Click it to reload the page.

## 11.2.3 DHCP Assigned IP Address

The facility of **View DHCP Assigned IP Addresses** provides information on IP address assignments. This information is helpful in diagnosing network problems, such as IP address conflicts, etc.

**DHCP IP Assignment Table** [Refresh](#)

DHCP server: Running

Index	IP Address	MAC Address	Leased Time	HOST ID
1	192.168.1.1	00-50-7F-27-E5-41	ROUTER IP	
2	192.168.1.11	00-50-7F-29-04-71	20:50:19.690	niki-pc
